

# Scalability to beyond Earth

- To what extent should CCMC just expand/adapt current models versus bring in new ones? Where should our emphasis be?
  - Are the current Earth-centric models correct/sufficient to apply to other regimes?
  - Is there anything we might be missing?
  - Is it better to run with what we have or should we look for outside options?

# Focus

- Should we pick a targeted question to address our beyond Earth capabilities? What do we already have that can be applied? What else needs to be brought in?
  - Which question? Multiple questions?
  - One location? One aspect of space weather?
  - What could we miss by having too narrow of a focus?
