

# **Solar Energetic Particles (SEPs) and Impacts**

*Yihua Zheng*

**Space Weather Training at KSC, Feb 2 – 4, 2016**

# SEPs – important source of space radiation: hard to predict

## Deep space dangers

Mars explorers will need protection from galactic cosmic radiation, which researchers say would plow into cells like molecular artillery.

## Galactic Cosmic Radiation (GCR) -- another source

# SEPs: What are they?

## *Definition:*

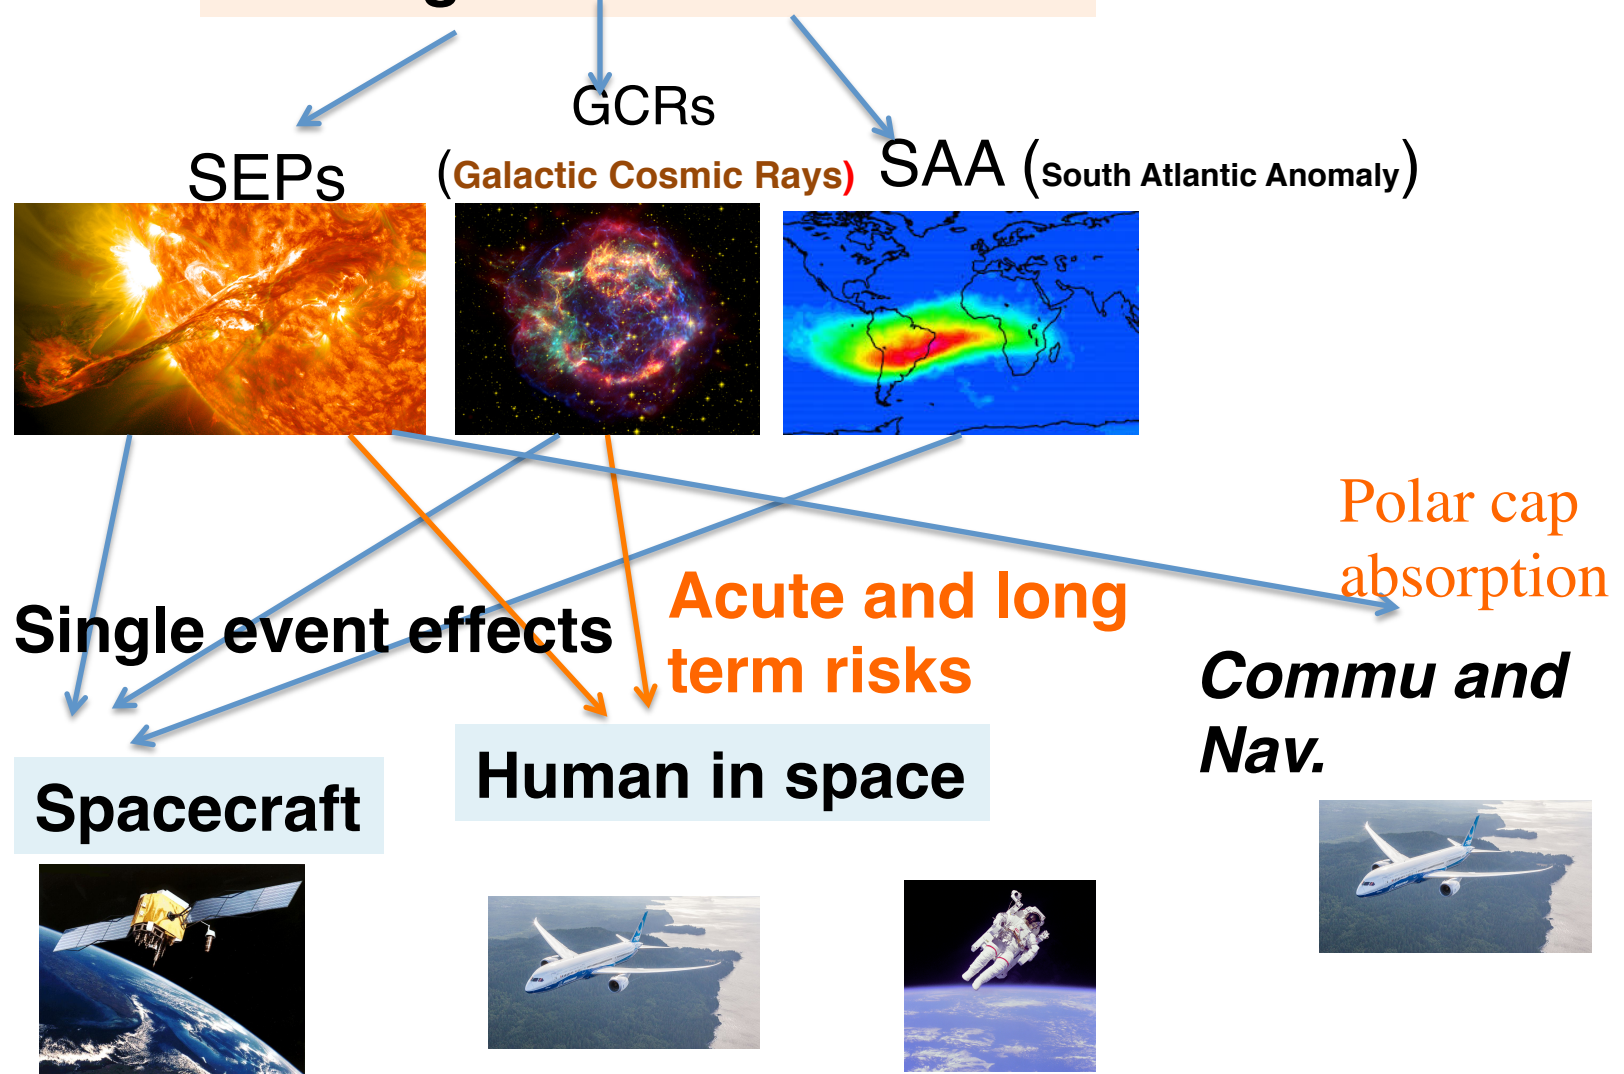

Energetic charged particles (such as electrons protons and other heavy ions) traveling much faster than ambient particles in the space plasma, at a fraction of the speed of light (relativistic!).

They can travel from the Sun to the Earth in one hour or less!

The term “SEP” usually refers to protons.

# Why do we care?

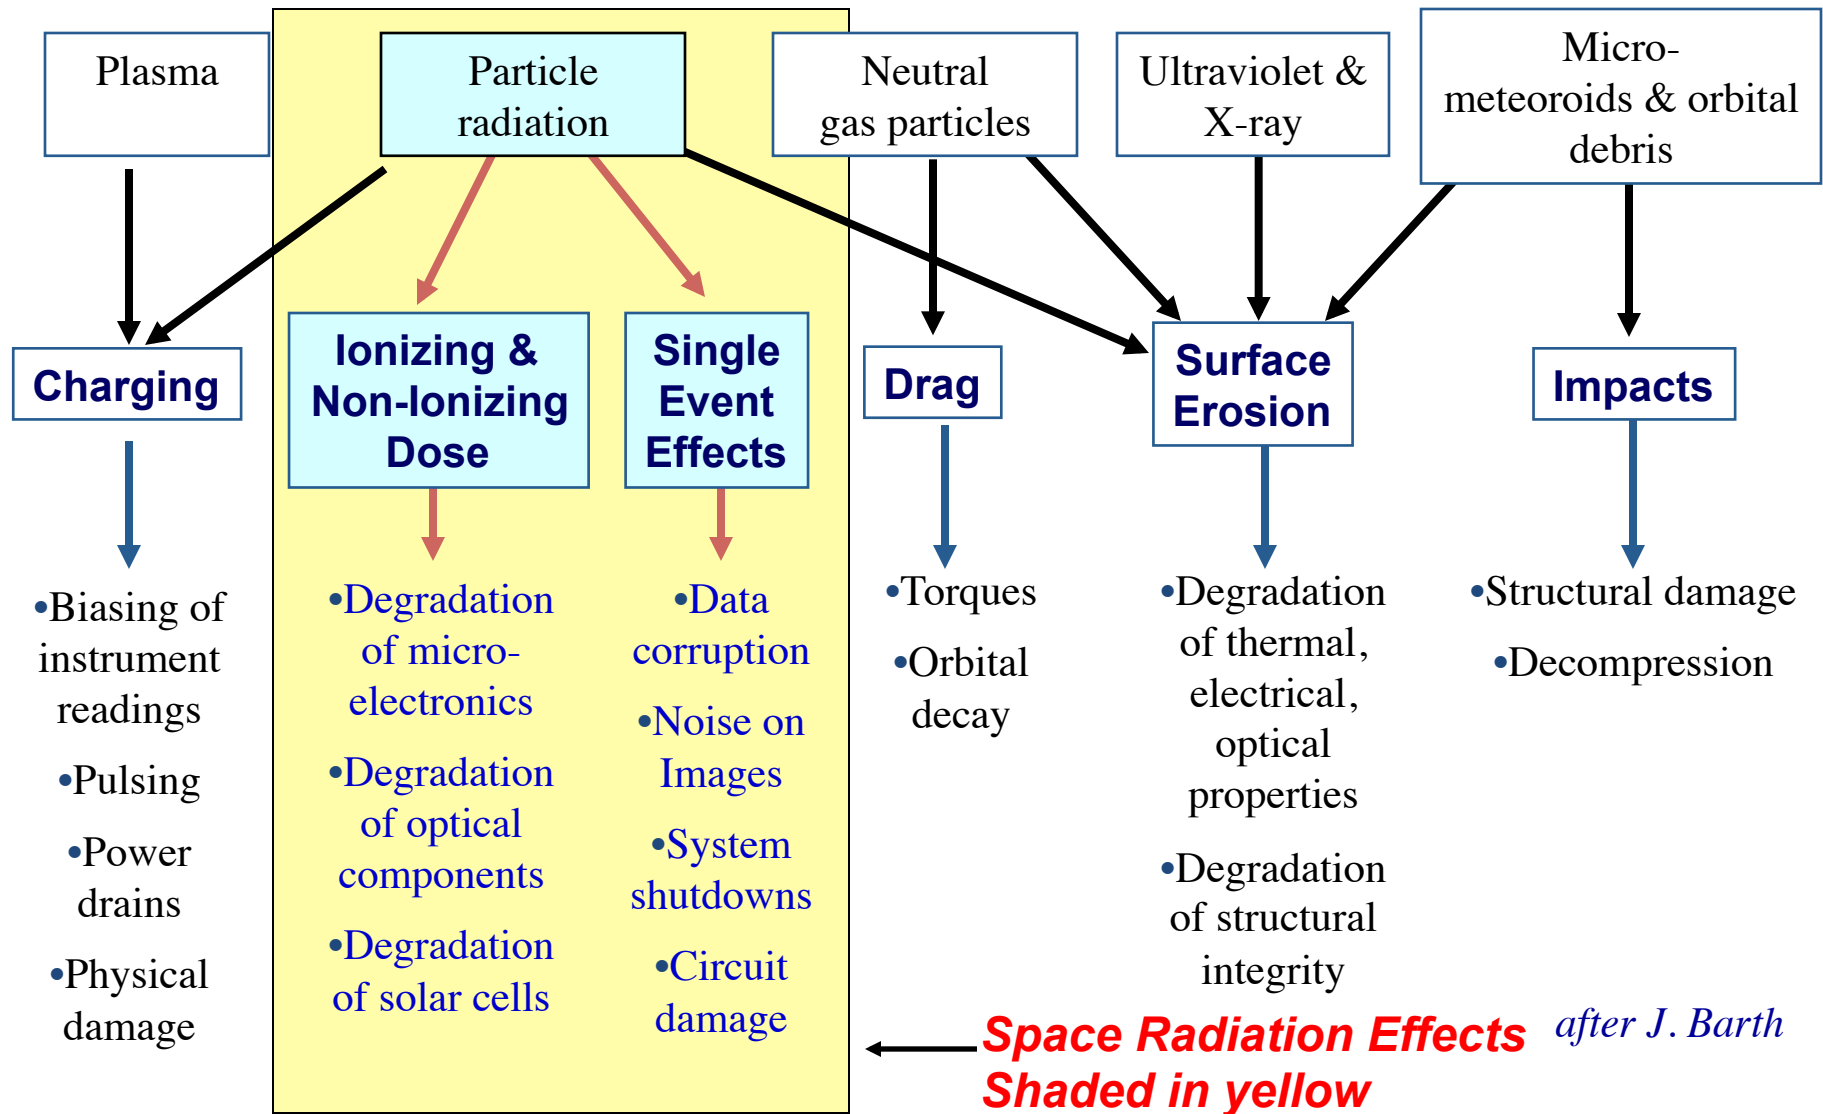

## Ionizing radiation storms

# CMEs Can Widen Longitudinal Extent of SEP Events

# CMEs Can Widen Longitudinal Extent of SEP Events

# CME and SEP path are different

CME: could get deflected, bended, but more or less in the radial direction

# How Do We Monitor SEP Levels?

(1 pfu = 1 particle flux unit =  $1/\text{cm}^2/\text{sec}/\text{sr}$ )

*Track the particle flux at different locations.*

*Flux units: pfu, pfu/MeV*

- **Heliosphere with STEREO In-situ Measurements of Particles and CME Transients (IMPACT)**
  - *Differential energy band; Units measured, some energy ranges are:*
- **Upstream of Earth with SOHO/COSTEP**
  - *Units measured, some energy ranges are:*
- **Geostationary Orbit with GOES**
  - *Integral flux, Units measured, some energy ranges are: pfu particle flux unit*

*Another useful quantity:*

*Fluence = flux integrated over the entire event.*

*Important for biological effects (flights)*

# SEP Intensity

Event magnitudes:

- > 10 MeV/nucleon integral

- fluence: can exceed  $10^9 \text{ cm}^{-2}$

- > 10 MeV/nucleon peak flux: can  
exceed  $10^5 \text{ cm}^{-2}\text{s}^{-1}$

# PARTICLE SNOW!

# How do we define an SEP Event?

*SWRC: SEP event detections are defined as:*

*GOES Proton  $E > 10$  MeV channel  $> 10$  pfu*

*GOES Proton  $E > 100$  MeV channel  $> 1$  pfu*

# How Do We Quantify an SEP Event?

## NOAA Space Weather Scale for Solar Radiation Storms

Category		Effect	Physical measure	Average Frequency (1 cycle = 11 years)
Scale	Descriptor	Duration of event will influence severity of effects		
Solar Radiation Storms			Flux level of $\geq 10$ MeV particles (ions)*	Number of events when flux level was met (number of storm days**)
S 5	Extreme	<p><b>Biological:</b> unavoidable high radiation hazard to astronauts on EVA (extra-vehicular activity); passengers and crew in high-flying aircraft at high latitudes may be exposed to radiation risk.***</p> <p><b>Satellite operations:</b> satellites may be rendered useless, memory impacts can cause loss of control, may cause serious noise in image data, star-trackers may be unable to locate sources; permanent damage to solar panels possible.</p> <p><b>Other systems:</b> complete blackout of HF (high frequency) communications possible through the polar regions, and position errors make navigation operations extremely difficult.</p>	$10^5$	Fewer than 1 per cycle
S 4	Severe	<p><b>Biological:</b> unavoidable radiation hazard to astronauts on EVA; passengers and crew in high-flying aircraft at high latitudes may be exposed to radiation risk.***</p> <p><b>Satellite operations:</b> may experience memory device problems and noise on imaging systems; star-tracker problems may cause orientation problems, and solar panel efficiency can be degraded.</p> <p><b>Other systems:</b> blackout of HF radio communications through the polar regions and increased navigation errors over several days are likely.</p>	$10^4$	3 per cycle
S 3	Strong	<p><b>Biological:</b> radiation hazard avoidance recommended for astronauts on EVA; passengers and crew in high-flying aircraft at high latitudes may be exposed to radiation risk.***</p> <p><b>Satellite operations:</b> single-event upsets, noise in imaging systems, and slight reduction of efficiency in solar panel are likely.</p> <p><b>Other systems:</b> degraded HF radio propagation through the polar regions and navigation position errors likely.</p>	$10^3$	10 per cycle
S 2	Moderate	<p><b>Biological:</b> passengers and crew in high-flying aircraft at high latitudes may be exposed to elevated radiation risk.***</p> <p><b>Satellite operations:</b> infrequent single-event upsets possible.</p> <p><b>Other systems:</b> small effects on HF propagation through the polar regions and navigation at polar cap locations possibly affected.</p>	$10^2$	25 per cycle
S 1	Minor	<p><b>Biological:</b> none.</p> <p><b>Satellite operations:</b> none.</p> <p><b>Other systems:</b> minor impacts on HF radio in the polar regions.</p>	10	50 per cycle

# Human Safety in Space

- GCR
- **SEP**

Johnson Space Center/Space Radiation Analysis Group (SRAG)

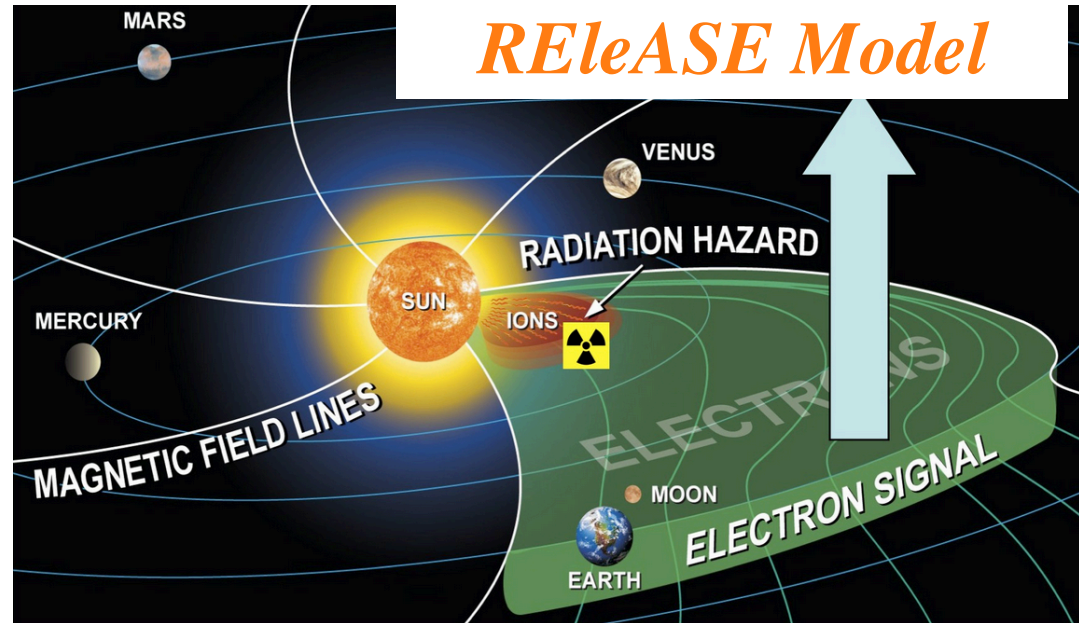

Limit: the  $> 100$  MeV flux exceeding 1pfu  
(1 pfu = 1 particle flux unit =  $1/\text{cm}^2/\text{sec}/\text{sr}$ )

- All clear (EVA –extravehicular activity)

# Can we predict SEP events?

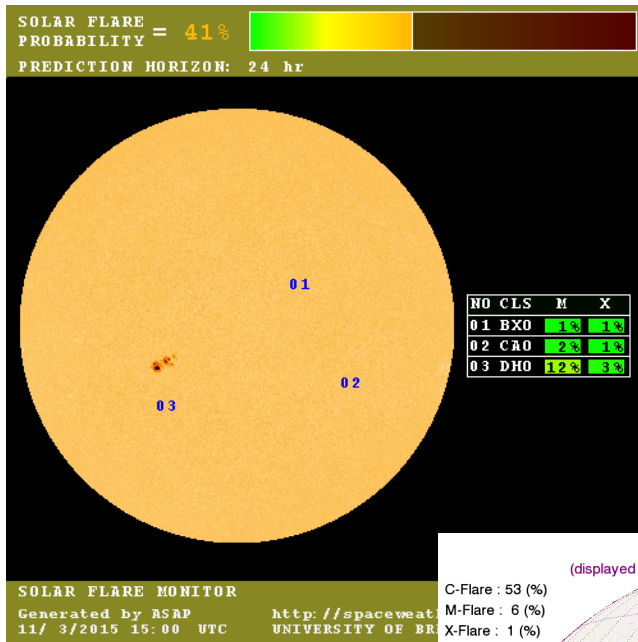

Uses detection of high energy \*electrons\* to predict arrival of high energy \*protons\*

Data source: SOHO  
COSTEP

AR 11577

# How Often Do SEP Events Occur?

*SEP event detections in the near-Earth environment  
(GOES 13, Proton  $E > 10$  MeV channel)*

*2007-2009: Zero Events - Solar Minimum Indeed!*

*Total Events*

*Since March 2011  
STEREO A: 16  
STEREO B: 11*

*Recognizing profile shapes of SEP flux and  
associating it with the source/driver*

# East-West Asymmetry in Solar Proton Events; Intensity Profiles at ~5, ~15 and ~30 MeV (adapted from *Cane et al., 1988*)

Western event;  
S/C is well connected to solar event; prompt particle rise to peak then decay; weak shock flank may be encountered.

Near Central Meridian event;  
Reasonably prompt rise; Peak, especially at lower energies, is typically near shock passage.

Far Eastern event: S/C is very poorly connected. Gradual rise, may have extended duration as populated field lines corotate to S/C.

Eastern event: S/C is poorly connected to solar event. Gradual rise, peak near/after shock flank passage.

Synthesis of observations of 235 events over 20 years. Different intensity-time profiles are ordered by the varying connection to the solar event and shock.

Impulsive: The “peak at the beginning due to flare, fall off” – indicates how well connected you are to the source (timing)

Gradual: The “jump up from flare/CME, slow rise  
Then peak when the ICME passes the spacecraft”

The “slow rise then peak, (slow rise can let you know that you are not well connected  
ICME doesn’t hit spacecraft so falls off”

# The “multiple event weirdness”

# July 23, 2012

Example where it reaches one spacecraft, then later another...

July 23 flare as seen in  
STEREO A EUVI 195

Increase of more than 5 orders of magnitude at STEREO A  
SEP event also detected by GOES,  
and later enhancement seen at  
STEREO B (possibly due to IPS)

## For Earth – Best Connection is 45-60 degree west

*Energetic proton fluxes  
elevated for >12 hours*

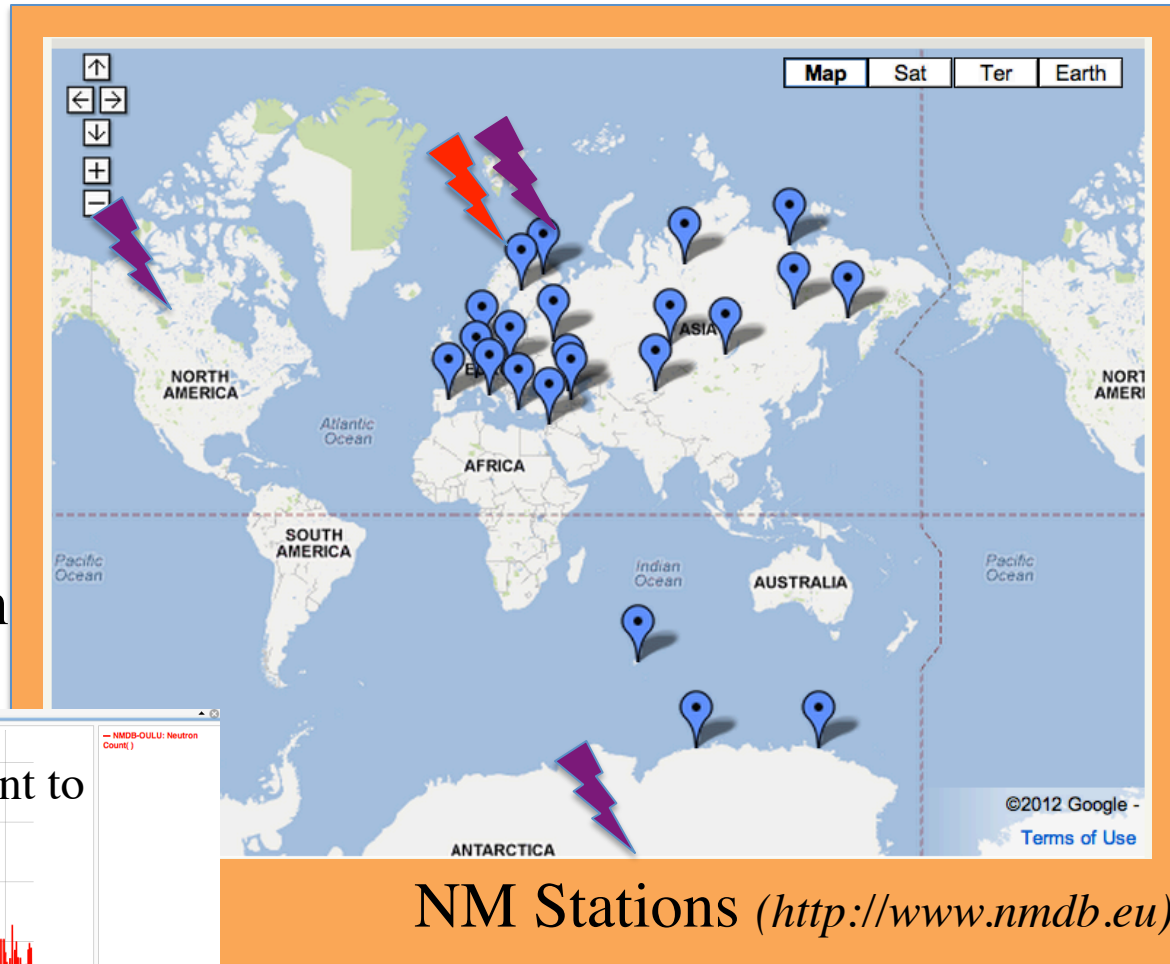

# Ground Level Enhancement

A subset of SEP events, a GLE event occurs when extremely high energy protons ( $>500$  MeV/nuc) penetrate the Earth's atmosphere. Collisions with atoms generate secondary particles that are measured at neutron monitoring (NM) stations on the ground.

## Neutron Monitoring Station in Oulu, Finland

Background ~105

NM Stations (<http://www.nmdb.eu>)

# What causes strongest SEP events? Or, how do the drivers relate to the SEP Flux?

Difficult to distinguish GLE from traditional SEP events:

- Complexity of Active Region (AR)
  - Most young, more compact
- Magnetic connectivity of AR
  - About ~50% are well connected
- Magnitude of flare
  - Average X3.8, but as low as M7.1
  - Long duration
- Magnitude of CME
  - Range of speeds (~2,000 km/s average, but four events <1,500 km/s)
- Seed particles
  - Known to have harder spectrum

*Gopalswamy et al. 2012, Li et al. 2012, Mewaldt et al. 2012*

**Table 1** GLE events and associated flares and CMEs (adopted from Gopalswamy et al. 2010)
