

# **Virtual Observatory: A Tool to Support Data Access & Data-Model Comparison**

Shing F. Fung

Geospace Physics Laboratory

NASA Goddard Space Flight Center

CCMC Workshop, Annapolis, Maryland, April 11-15, 2016

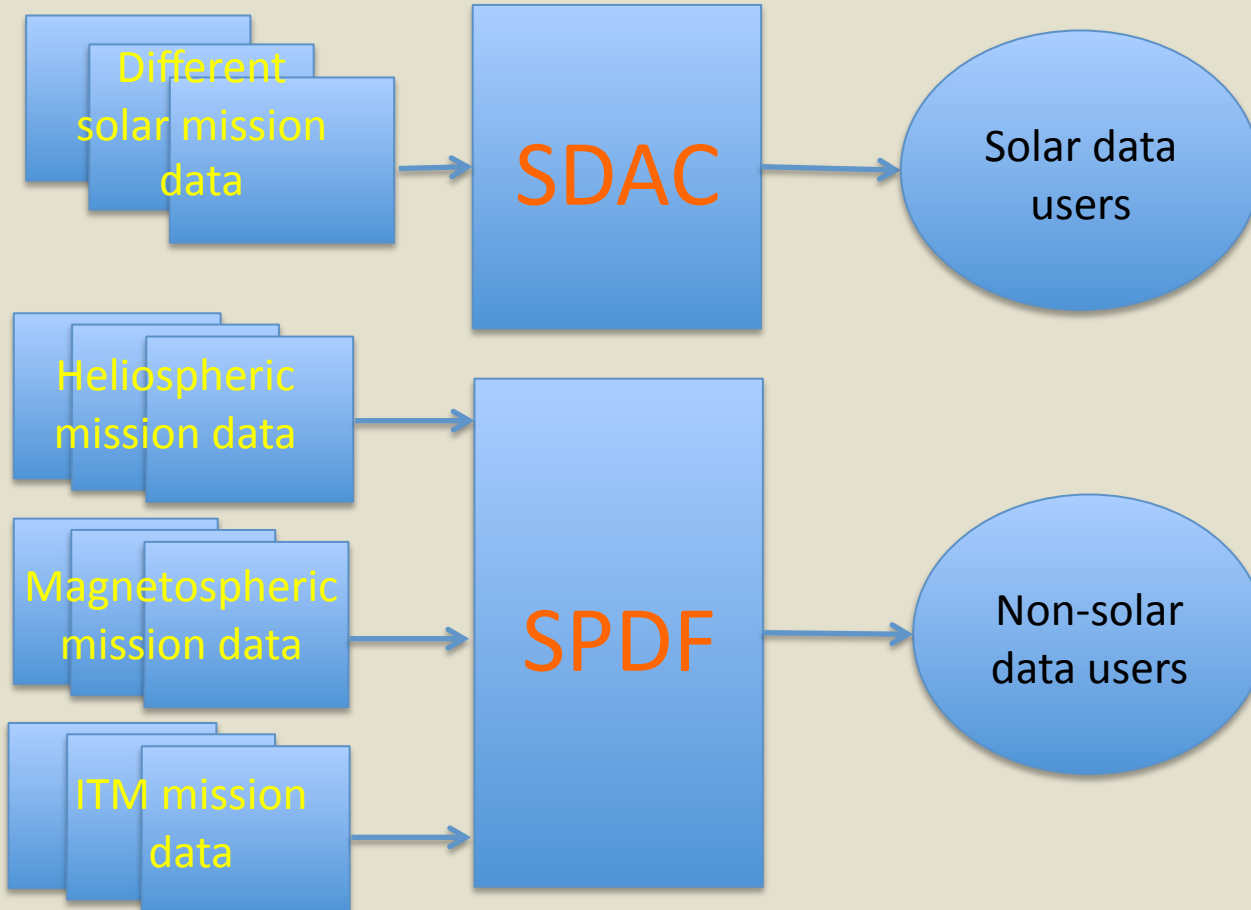

# NASA's Heliophysics System Observatory

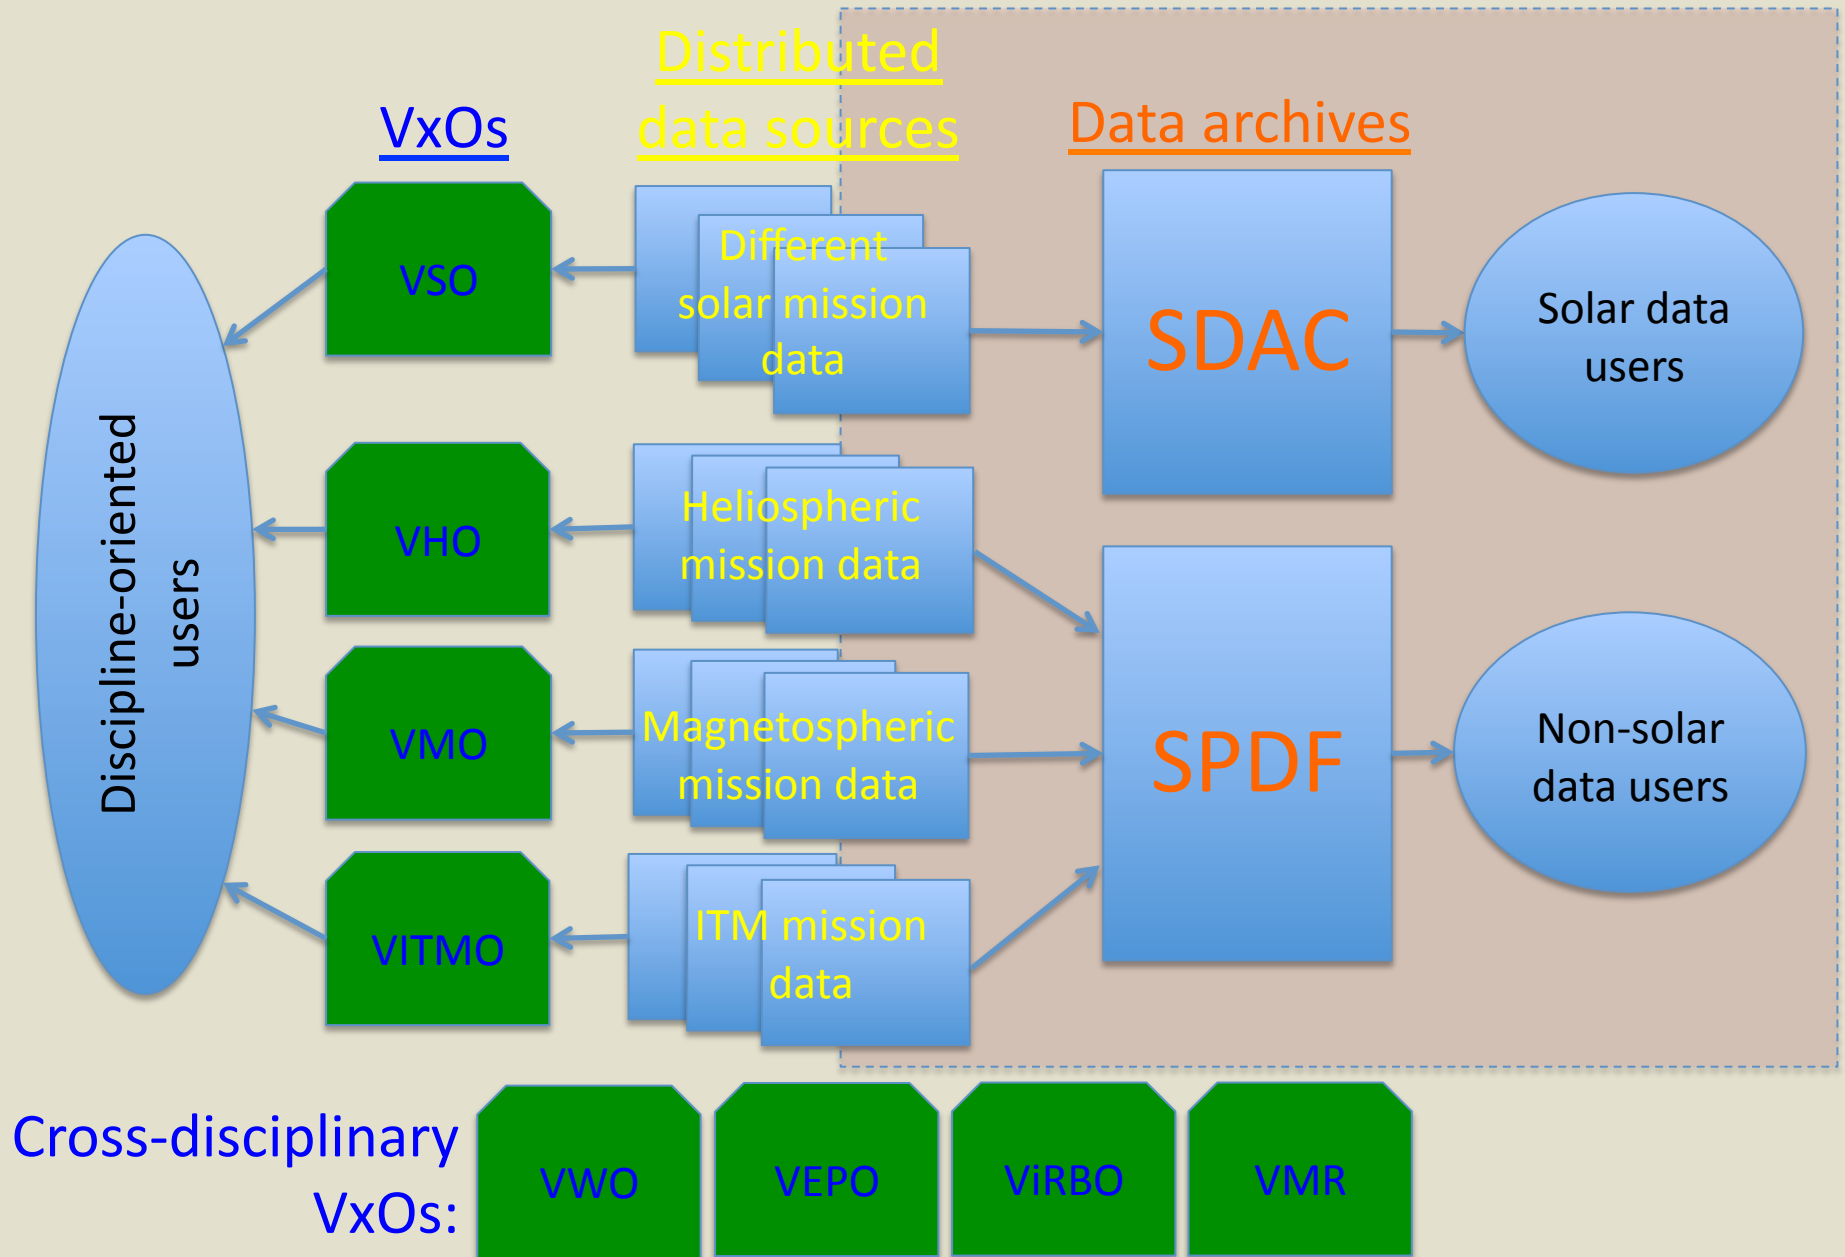

# Accessing Data from NASA Heliophysics Archives

Distributed  
data sources

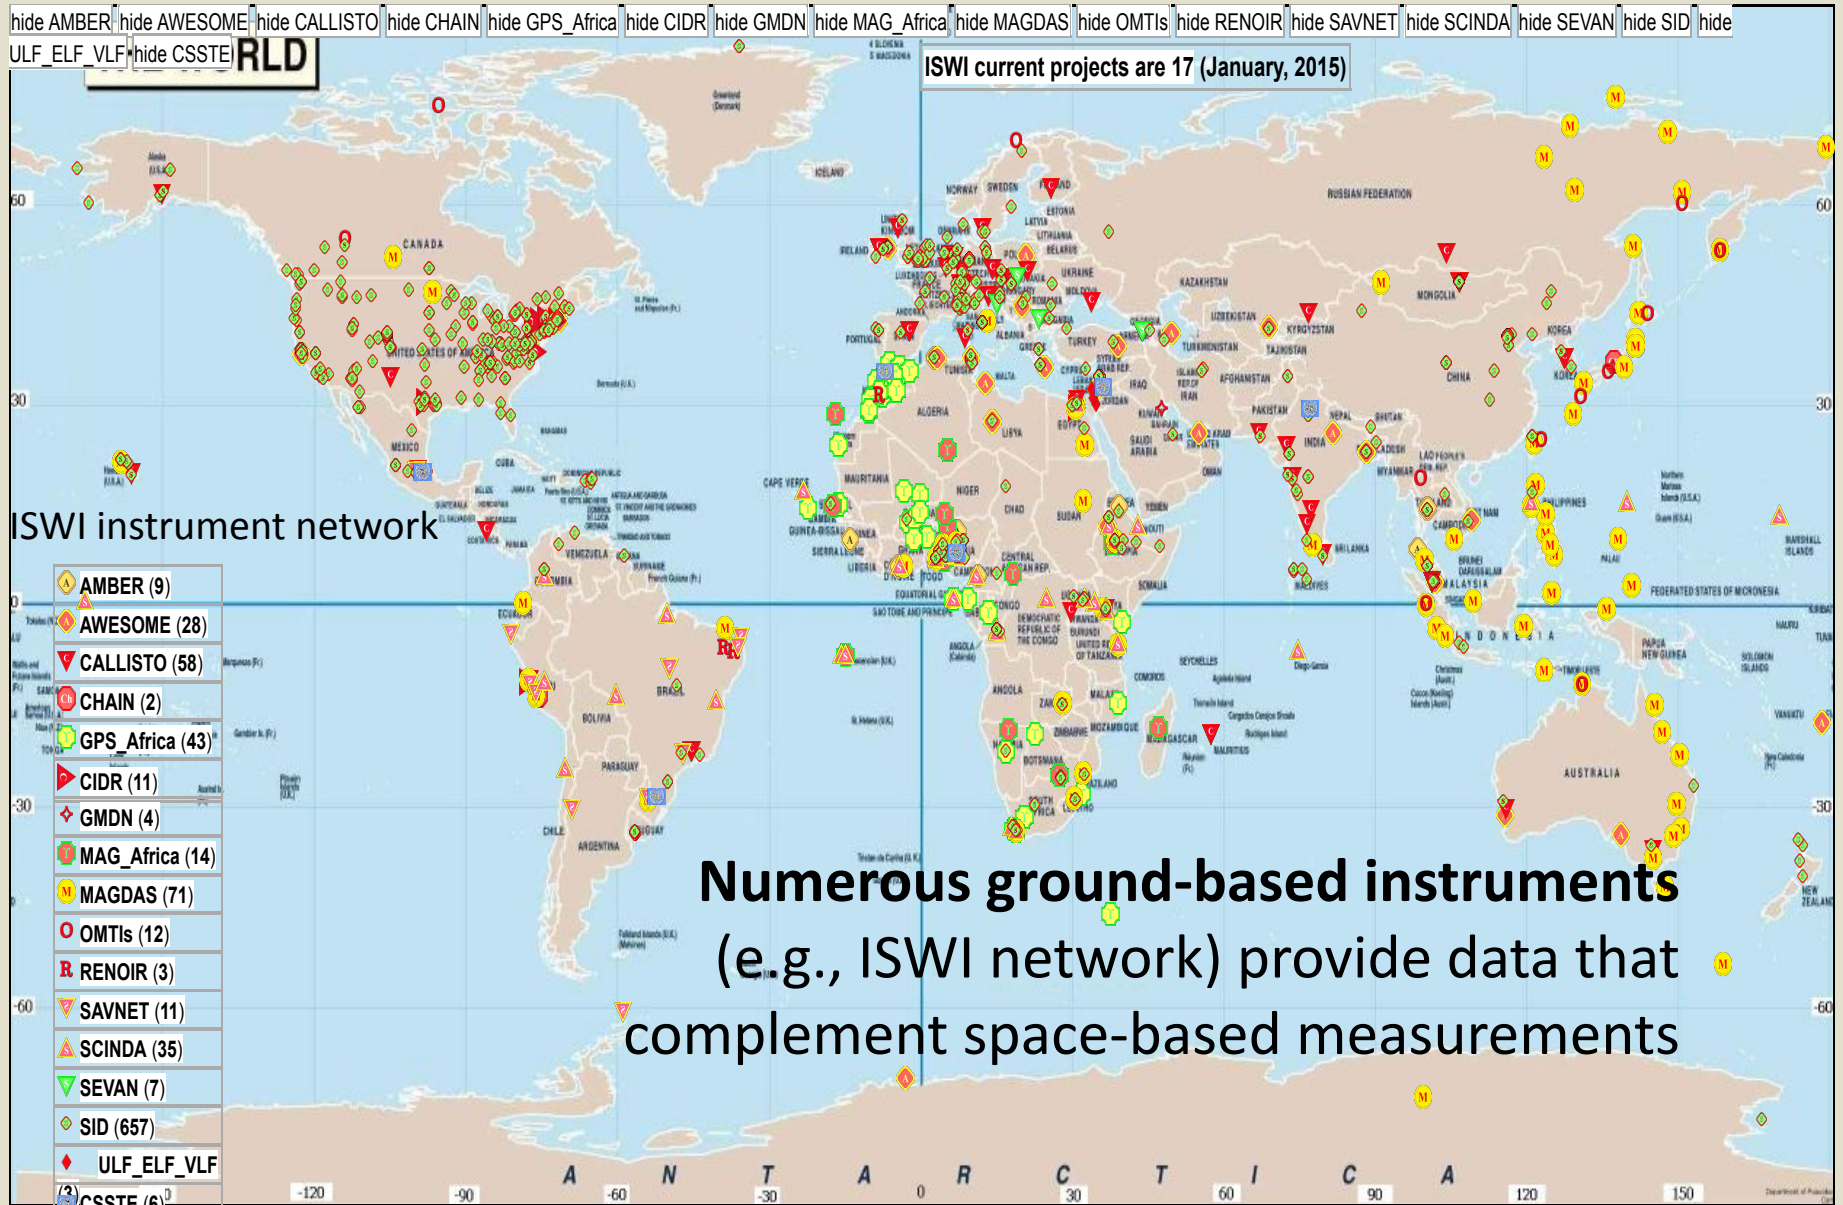

Data archives

# Heliophysics VxOs: A New Paradigm

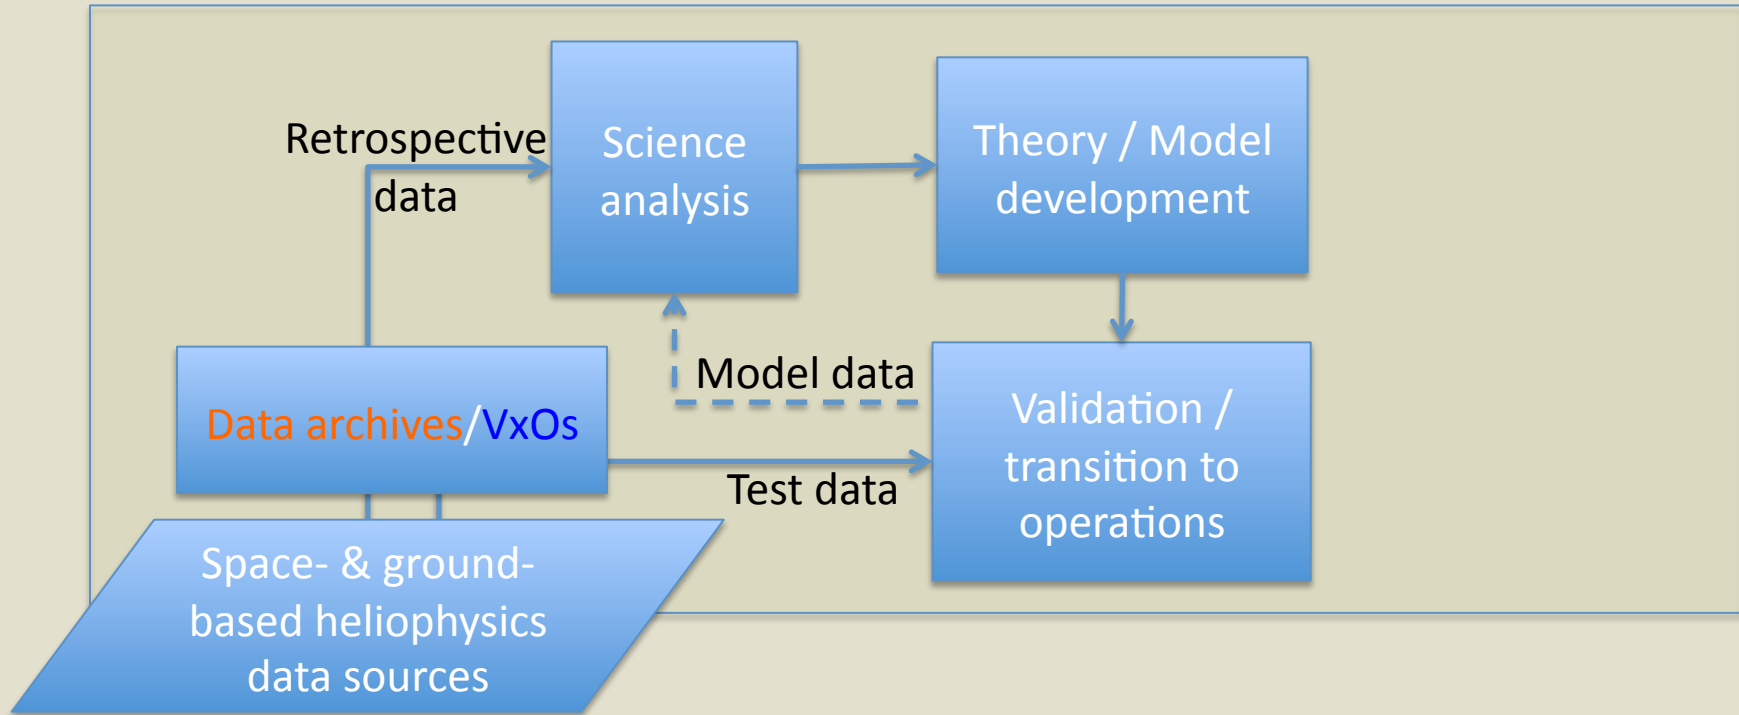

# International Space Weather Initiative (ISWI)

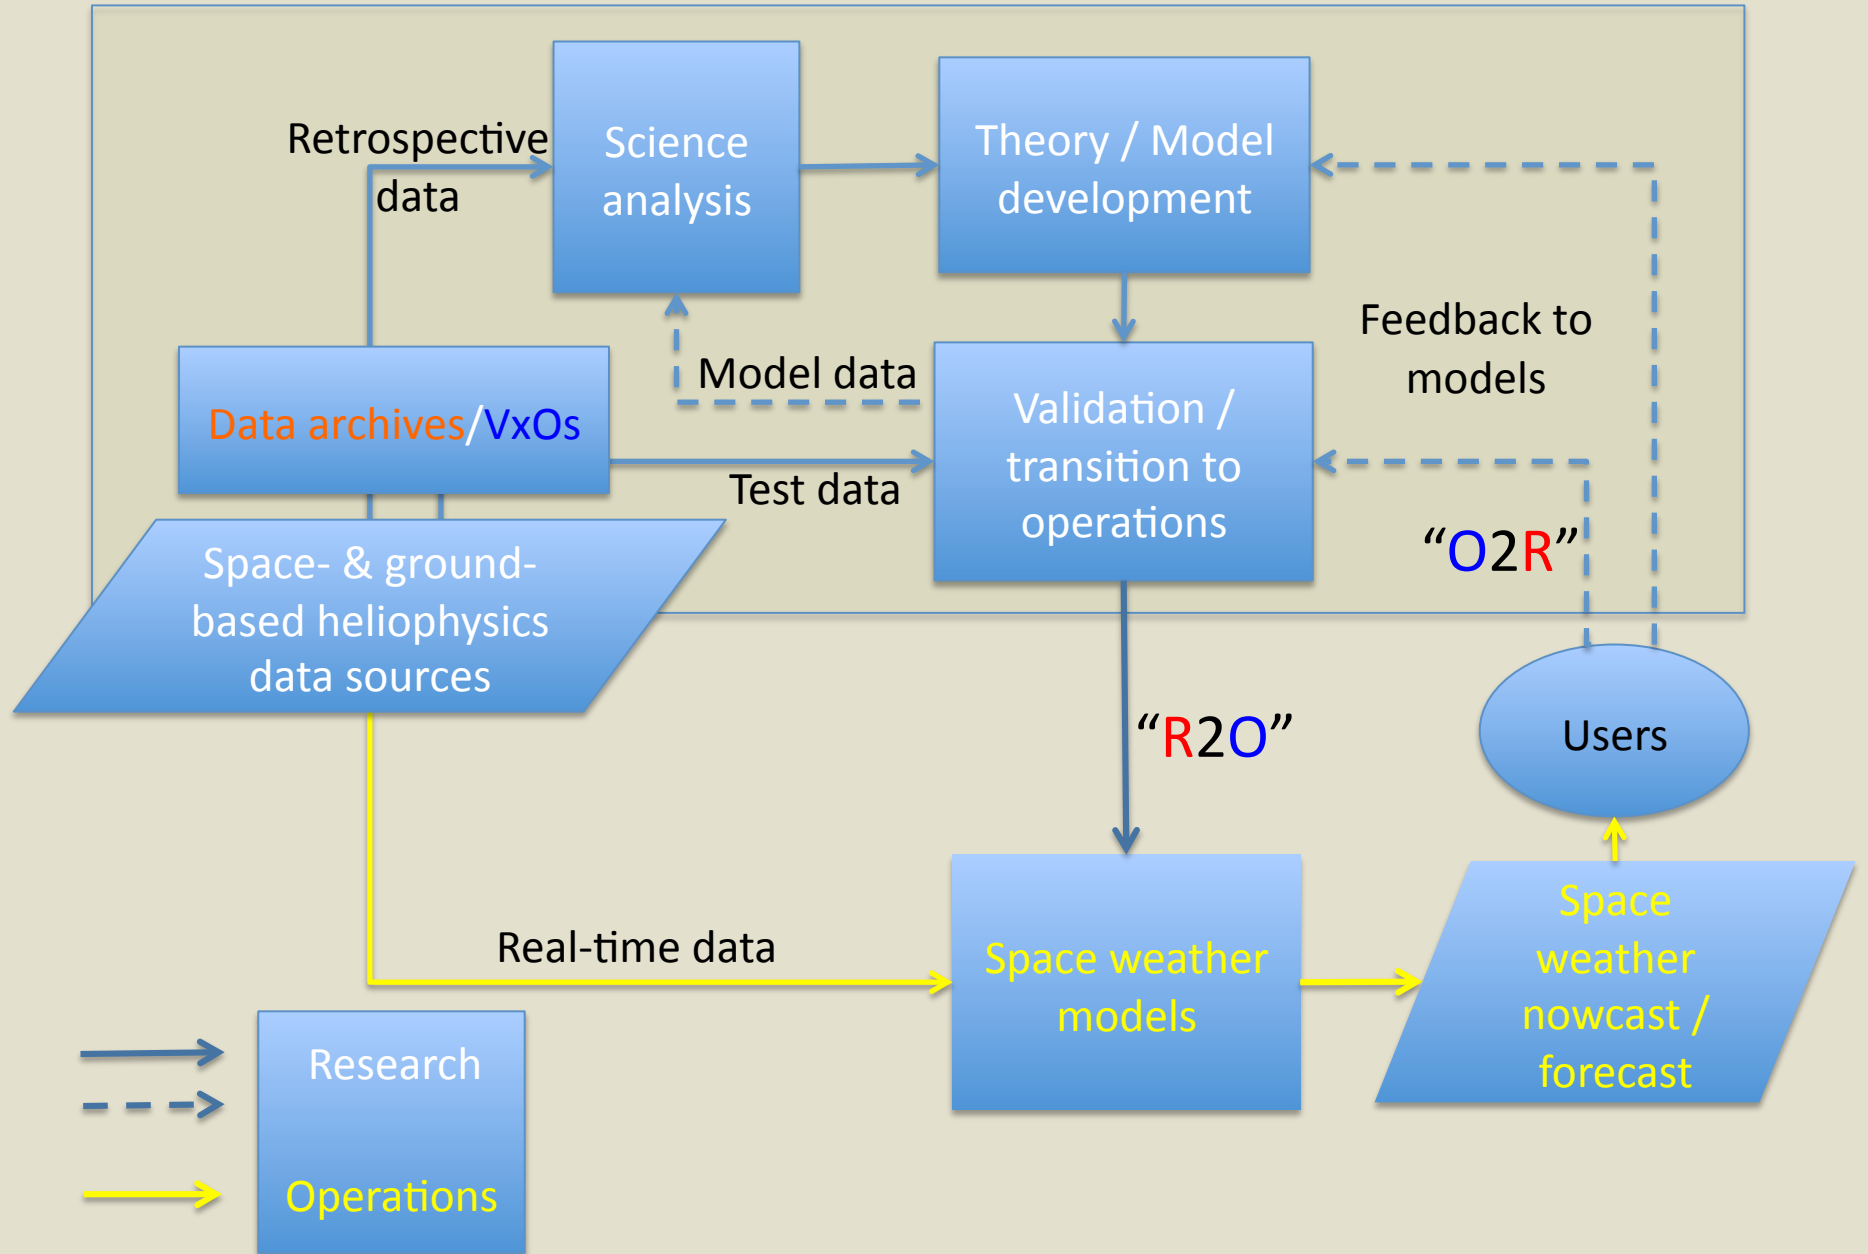

# “Big Data” Is Coming!

- Instruments are becoming data-intensive, e.g.,
  - Solar Dynamics Observatory ~1.4TB/day (science telemetry)
  - MMS ~137GB/day (higher-level science)
  - 100's-1000's ground stations, generating ~GB/day/station
- Diverse [space, ground, model (e.g. **CCMC**)] & distributed (**national** & **international**) data sources
- Effective data services need to **locate/search/access/retrieve/deliver** data efficiently
  - Large data volume in distributed data sources
  - Different data types and products
  - Diverse user needs

# Summary

- A virtual observatory can provide enhanced data services to
  - Augment existing data archive services
  - Support Diverse & distributed sources (space, ground, model)
  - Support diverse data users (research & operations)
  - Support effective data search mechanisms
    - Discipline orientation
    - Targeted data volume
- Enabling technologies
  - **Standard metadata model** to reduce s/w complexity
    - Same tools to search & access multi-disciplinary data
  - **Standard access protocols (APIs)**
    - Ensure interoperability
    - Enable system expandability by interfacing with new services

# Conceptual View of a Virtual Observatory
