

# Integrated Real-Time Modeling System for Heliospheric Forecasting

*Dusan Odstrcil (PI) — George Mason University & NASA/GSFC*  
*Lan Jian (Co-I) — University of Maryland College Park & NASA/GSFC*  
*Janet G. Luhmann (Co-I) — University of California at Berkeley*  
*and the CCMC Modelers Support Team*

- Introduction
- Improvements in Background Solar Wind Modeling
- Improvements in Launching Transient Disturbances
- Application of Synthetic White-Light Imaging
- Prediction of the Long-Duration Solar Energetic Particles (SEPs) Events
- Using IPS Data to Drive Heliospheric Predictions
- Summary

# WSA-ENLIL-Cone — Operational Predictions of Heliospheric Disturbances

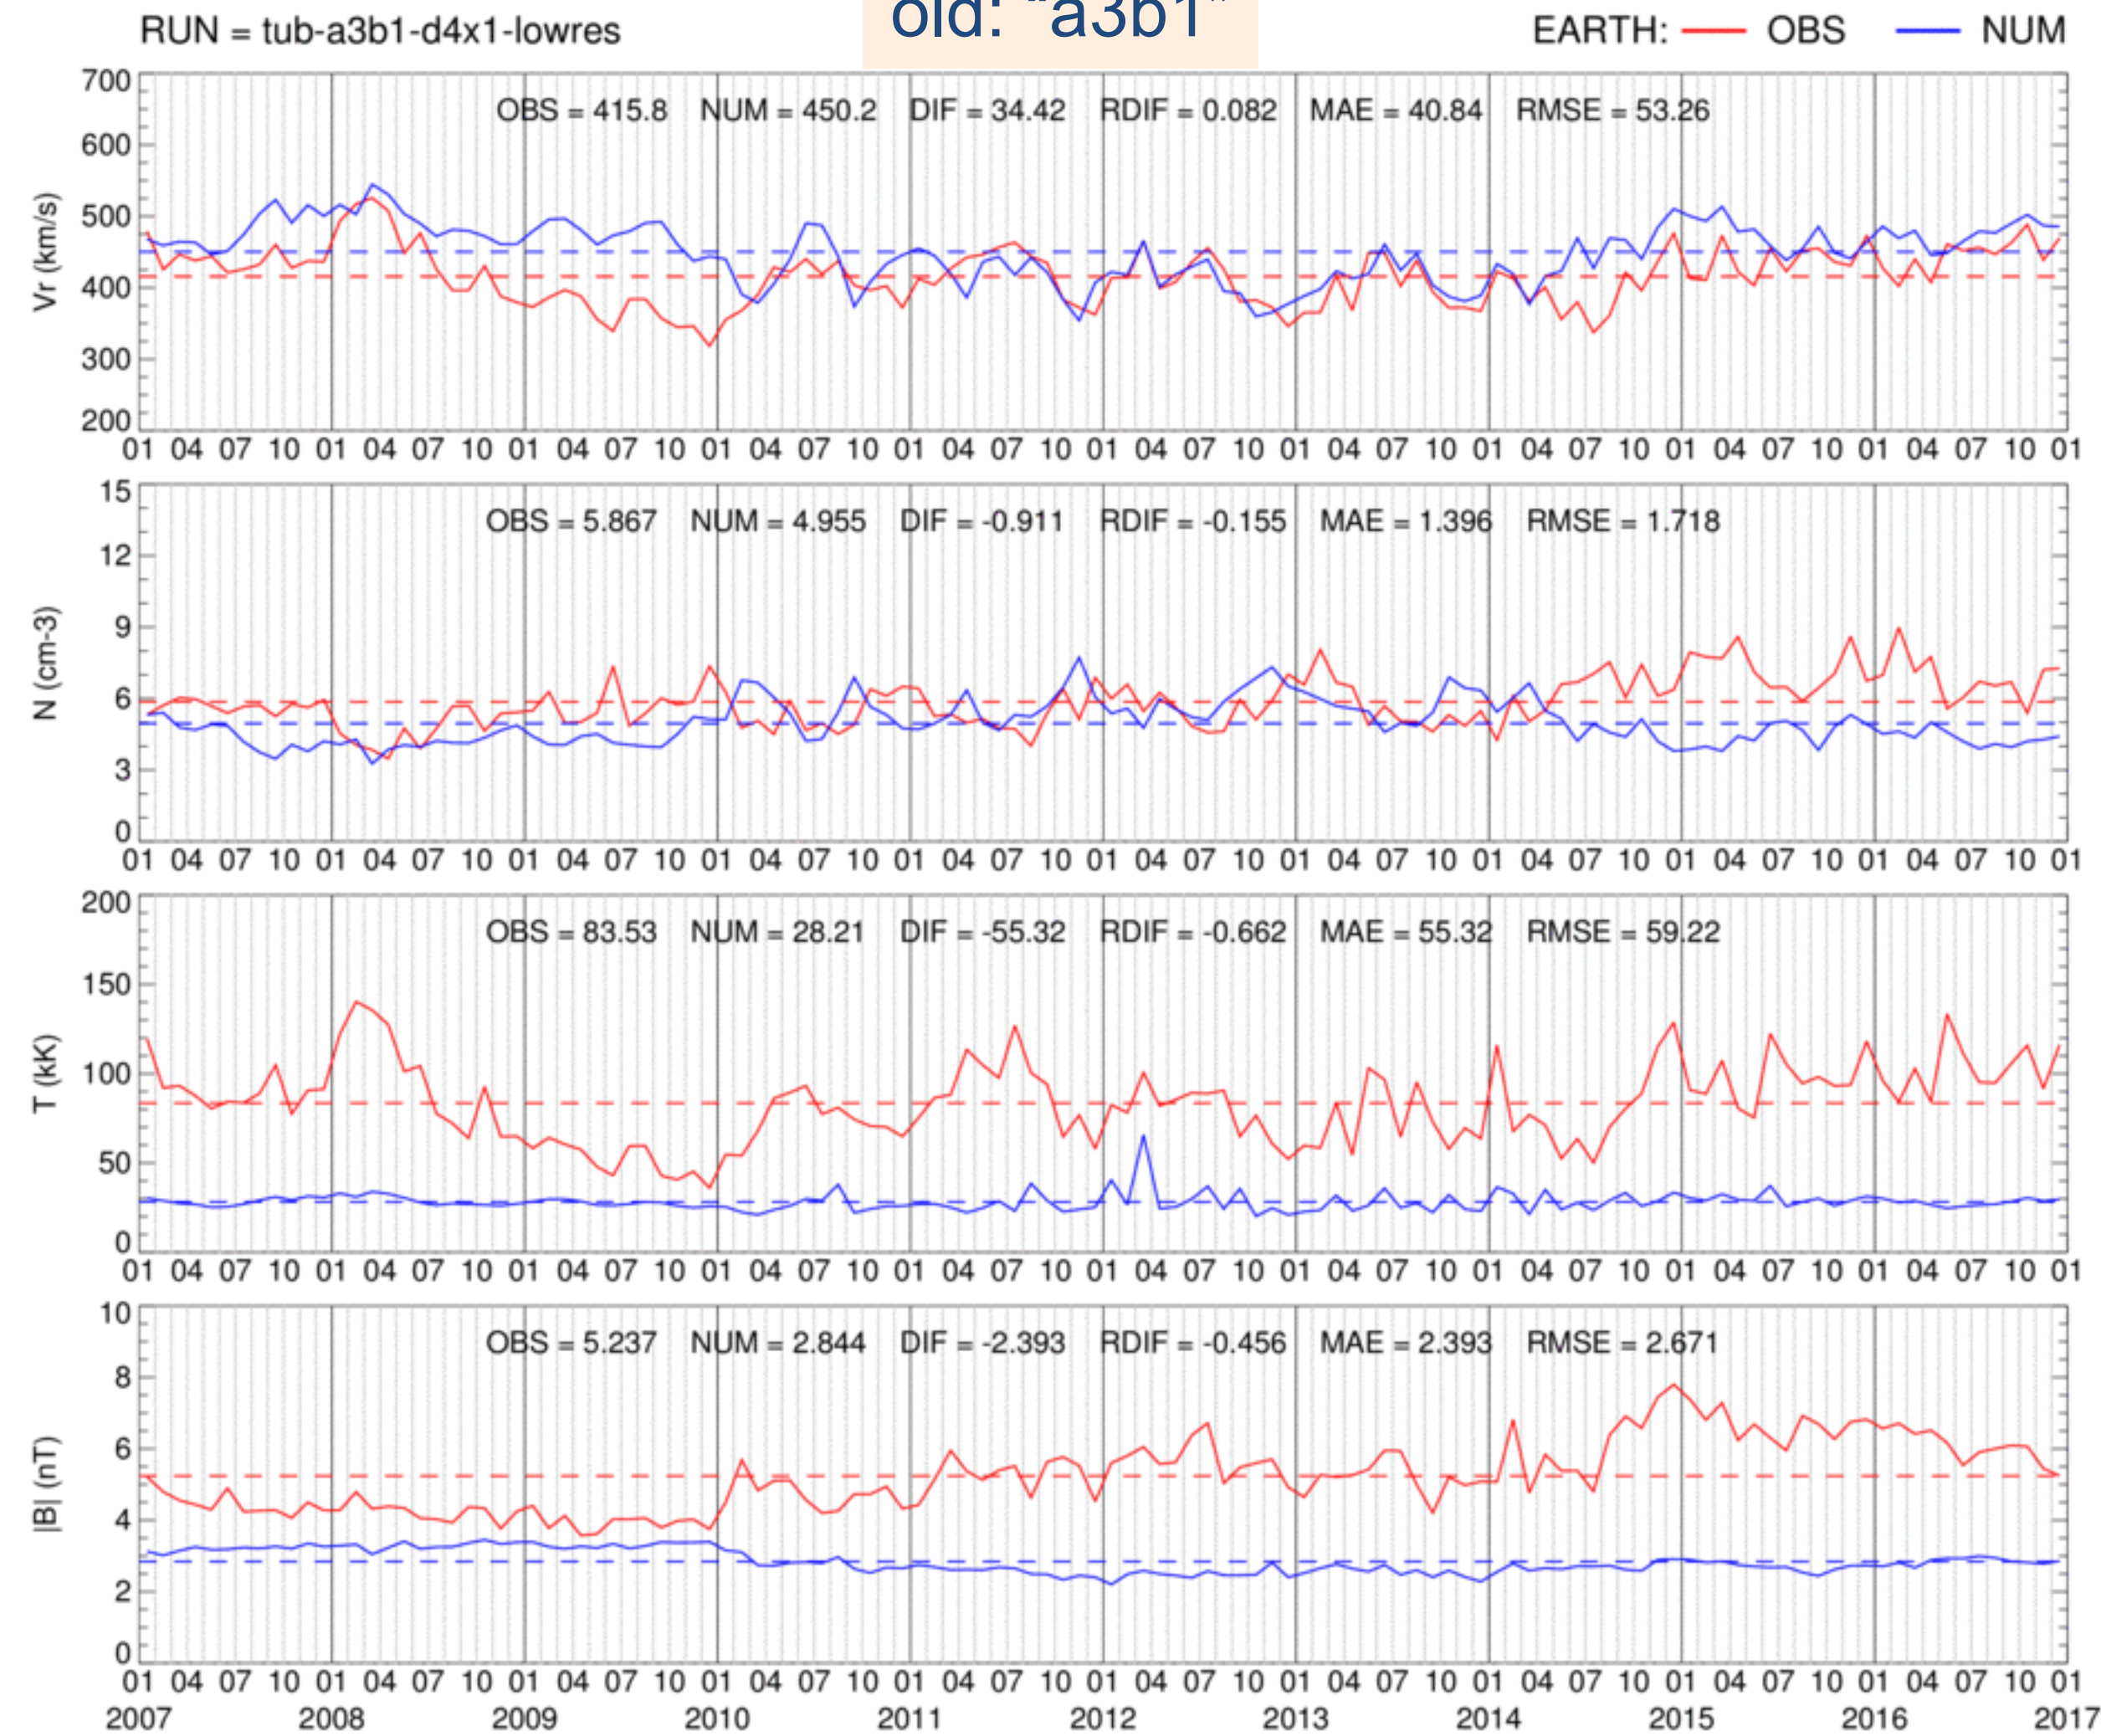

- Observationally driven, near-real time, “hybrid” modeling system for heliospheric space weather
- Routine simulation of co-rotating streams and CMEs, event-by-event, much faster than real-time
- Used at NASA/CCMC, NOAA/SWPC, UK Met Office, and Korean Space Weather Center

# Model Free Parameters — Background Solar Wind

| Parameter | a3b1 | a6b1 | a8b1 | Description   |
|-----------|------|------|------|---|
| bfast     | 300  | 350  | 500  | Radial magnetic field of fast stream (nT)                       |
| bslow     | 0    | 0    | 0    | Radial magnetic field of slow stream (nT)                       |
| bmean     | 0    | 0    | 400  | Radial magnetic field of mean stream (nT)                       |
| bscl      | 4    | 4    | 5    | Magnetic field scaling factor                                   |
| dfast     | 200  | 125  | 300  | Number density of fast stream (cm <sup>-3</sup> )               |
| dslow     | 2000 | 4000 | 5000 | Number density of slow stream (cm <sup>-3</sup> )               |
| dmean     | 0    | 0    | 500  | Number density of mean stream (cm <sup>-3</sup> )               |
| tfast     | 0.8  | 1.5  | 1.2  | Mean temperature of fast stream (MK)                            |
| tslow     | 0.1  | 0.1  | 0.1  | Mean temperature of slow stream (MK)                            |
| tmean     | 0    | 0    | 0.3  | Mean temperature of mean stream (MK)                            |
| vfast     | 675  | 700  | 700  | Radial flow velocity of fast stream (km/s)                      |
| vslow     | 225  | 200  | 200  | Radial flow velocity of slow stream (km/s)                      |
| vrfast    | 25   | 25   | 20   | Reduction of the maximum flow velocity (km/s)                   |
| vrslow    | 25   | 75   | 50   | Reduction of the minimum flow velocity (km/s)                   |
| shift     | 8    | 9    | 8    | Azimuthal shift at the inner boundary (deg)                     |
| nshift    | 1    | 1    | 1    | Azimuthal shift at the inner boundary (0-3)                     |
| alpha     | 0.05 | 0.05 | 0.05 | Fraction of alpha particles (rel. to protons)                   |
| dvexp     | 2    | 2    | 2    | Exponent in $N \cdot V^{dvexp} = \text{const}$ condition        |
| nptot     | 0    | 0    | 0    | 0 (1) if $P_{\text{th}} = (P_{\text{tot}})$ balance at boundary |
| nbrad     | 3    | 1    | 1    | Magnetic field correction                                       |

# Model Free Parameters — Background Solar Wind — Calibration

old: "a3b1"

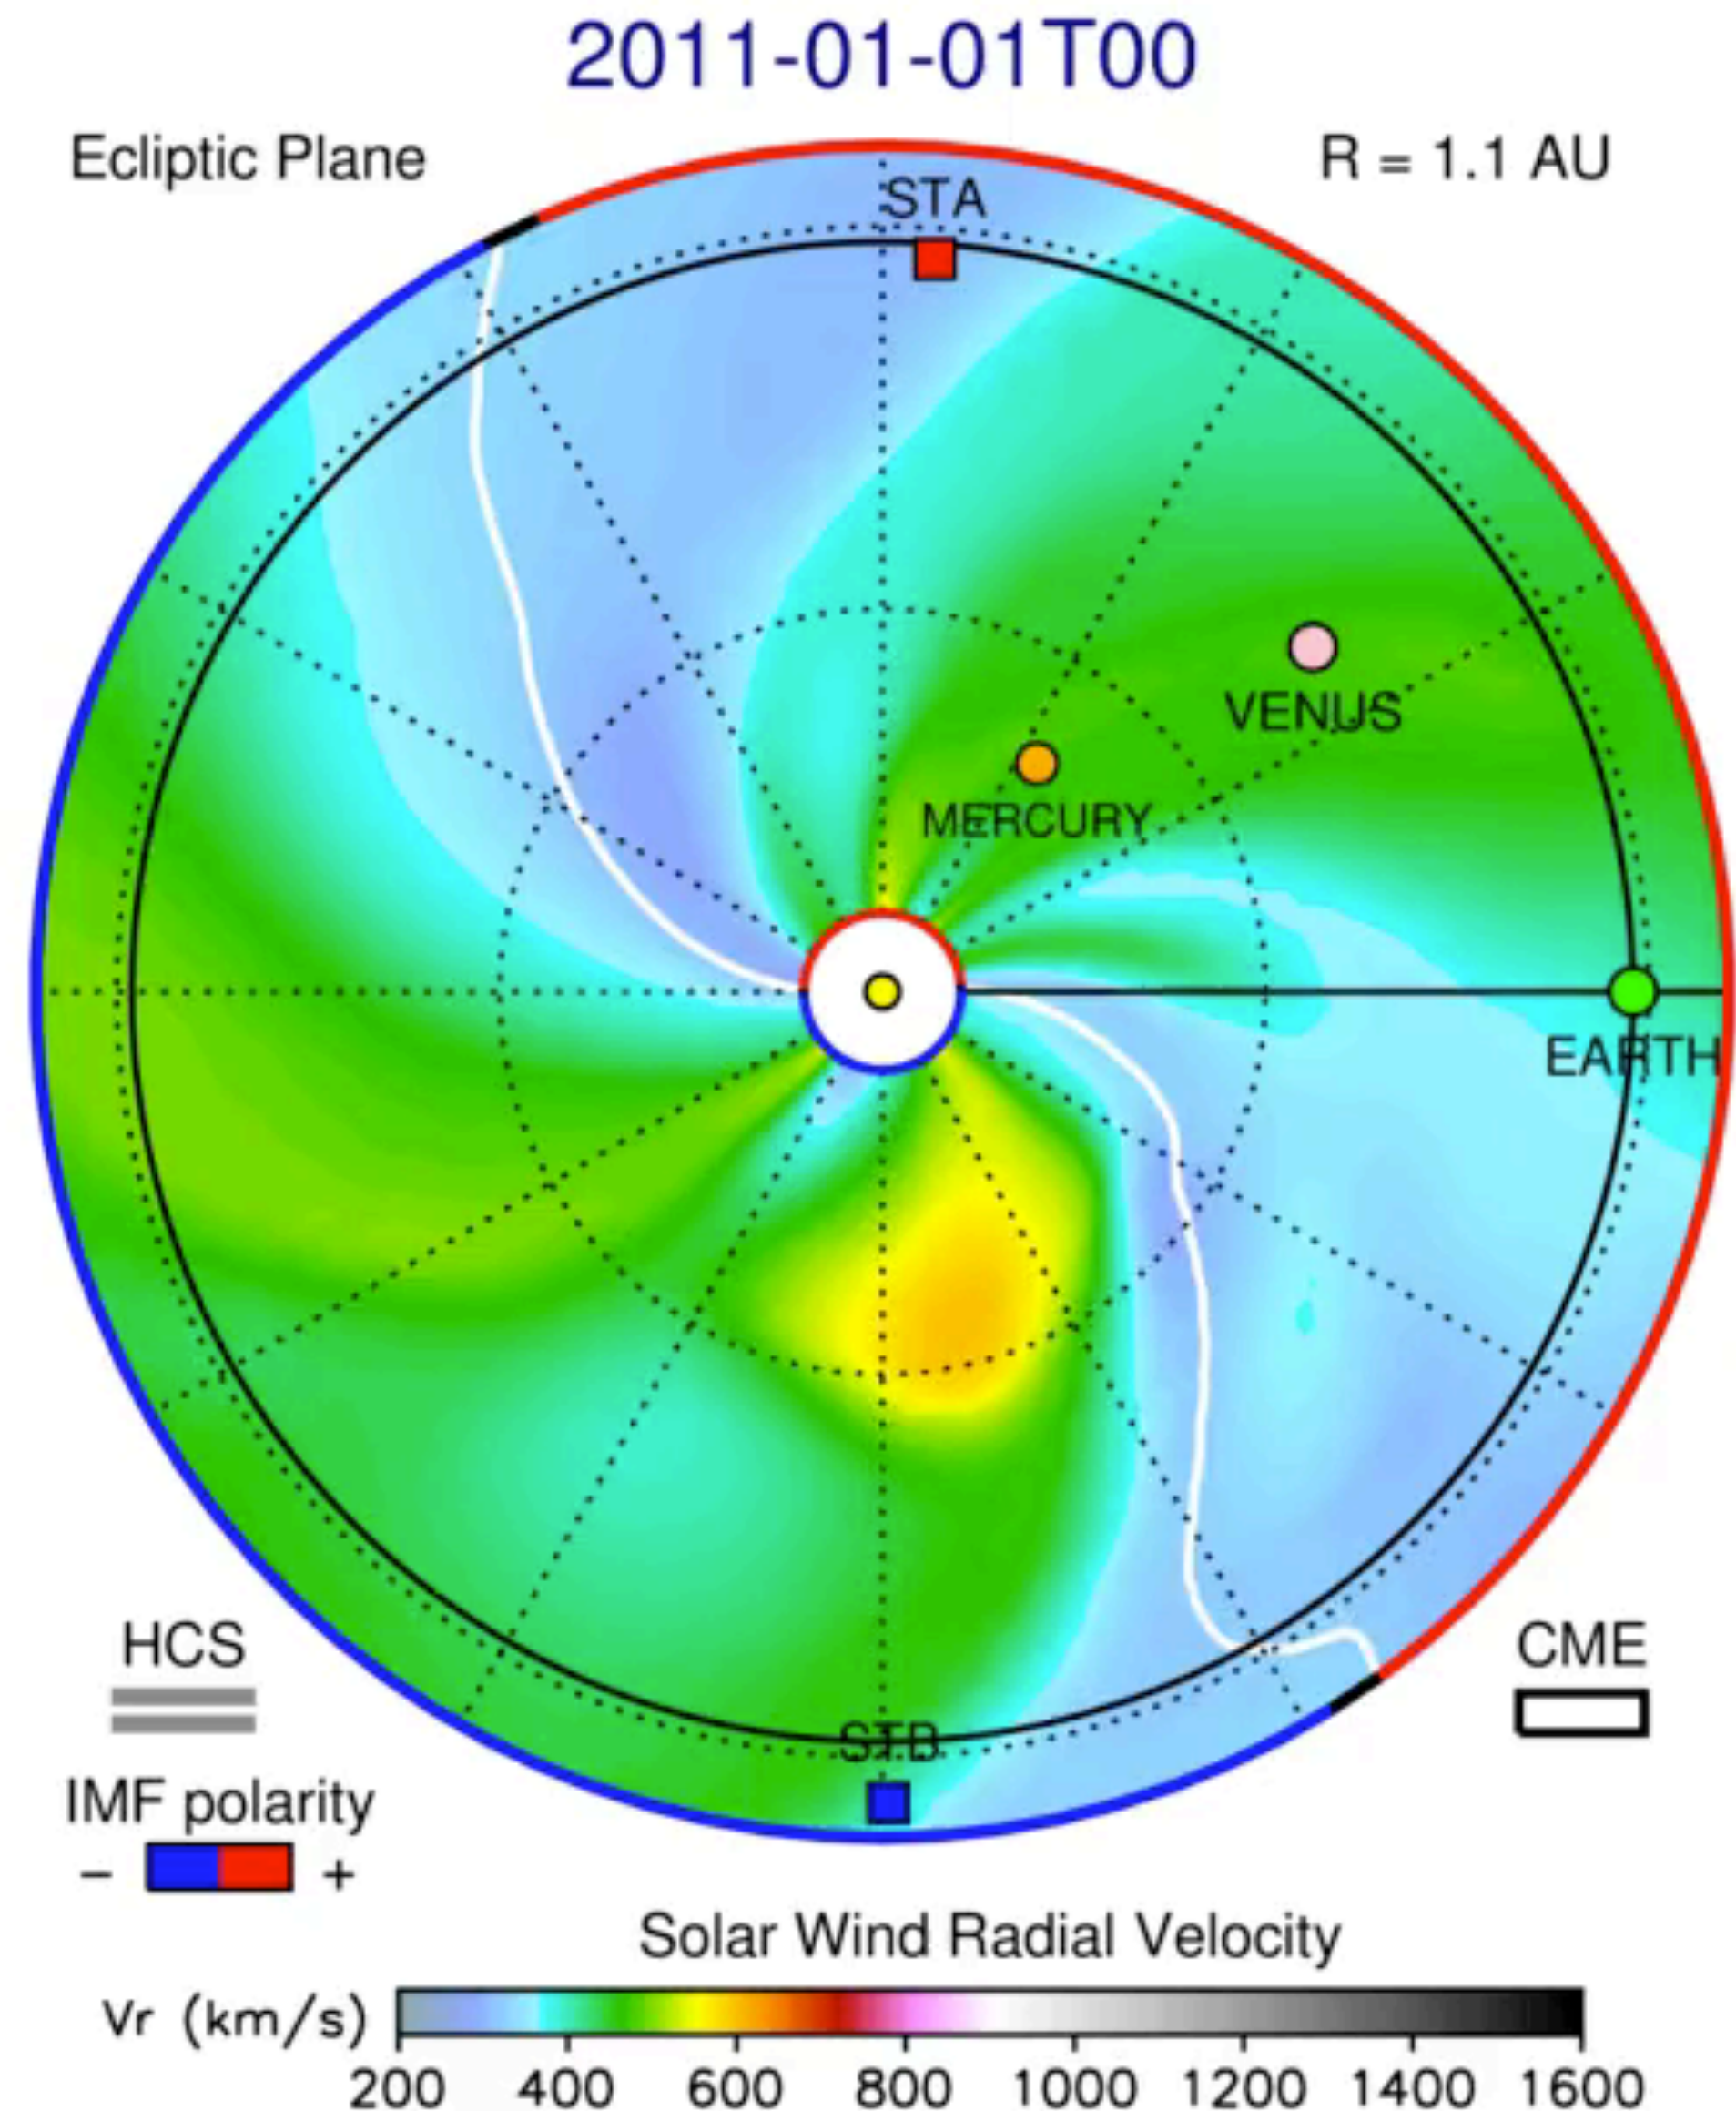

- Delivered: beginning of the solar cycle with limited calibration
- Motivation: ensure robustness & reasonable accuracy during the upcoming solar cycle maximum

new: "a8b1"

- Revised calibration with 2007-2016 (WSA) and 2010-2016 (CME-“cone”) data & larger robustness experience
- Using “mrzqs” instead of “mrbqs” GONG data

## Simulation:

- Sequence of 1826 WSA daily-updated (DU) maps provides radial components of the solar wind velocity and interplanetary magnetic field
- All 1756 CMEs fitted by CCMC/SWRC provides geometric and kinematic parameters to launch spherical hydrodynamic

## Visualization:

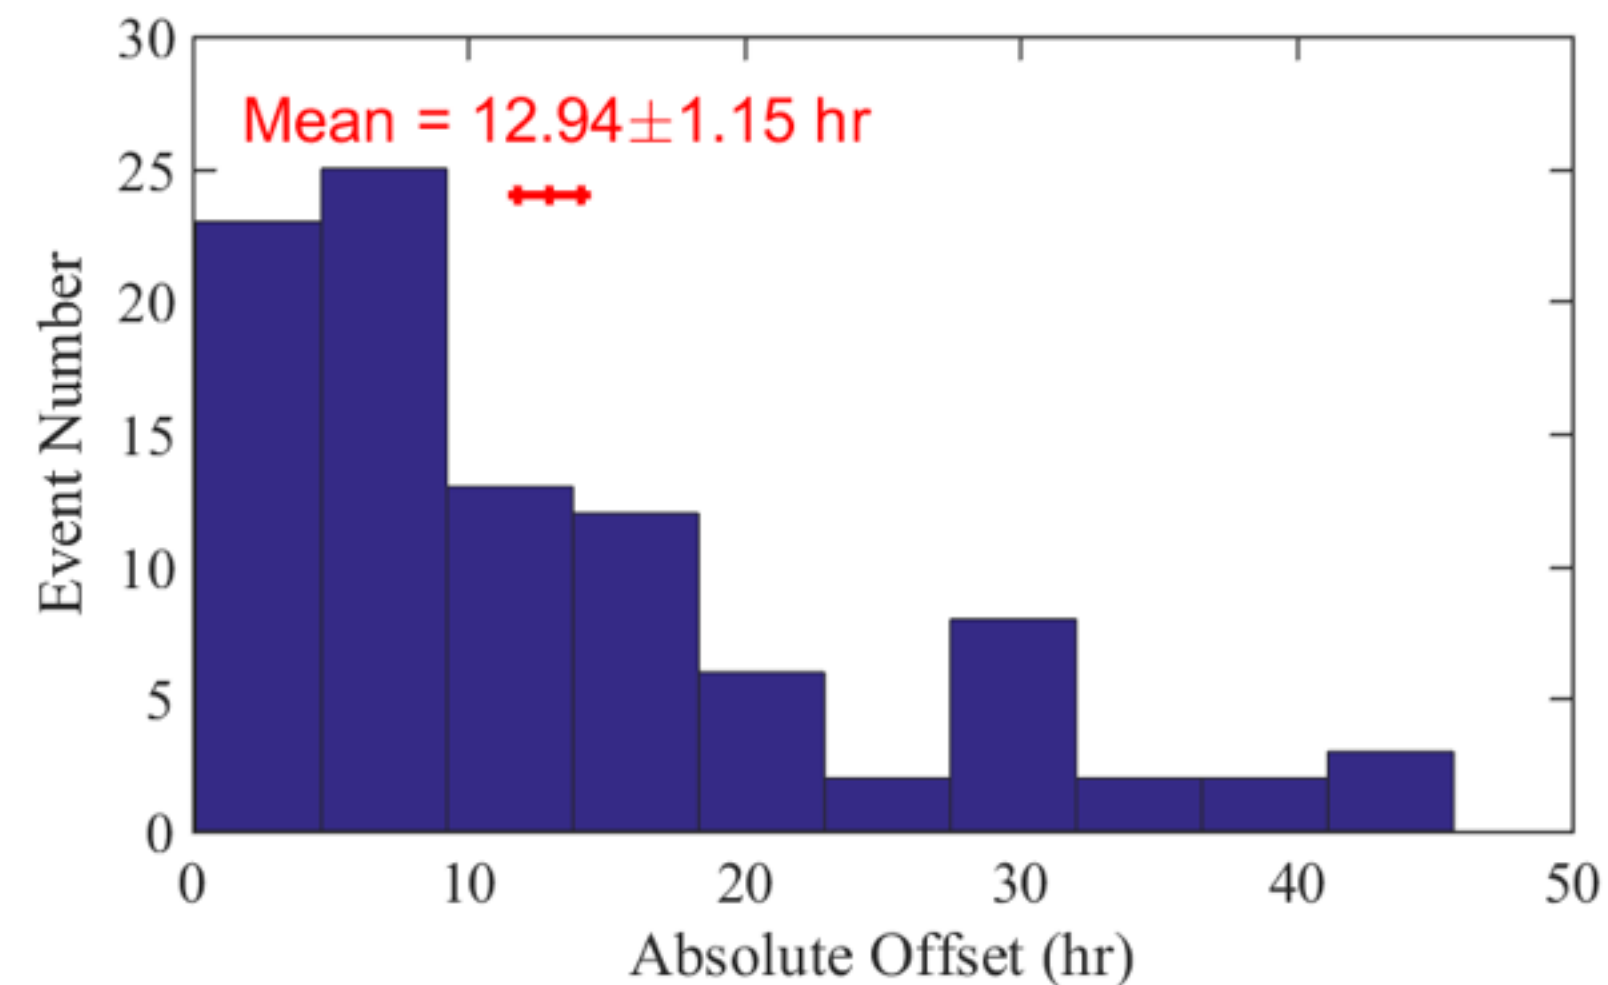

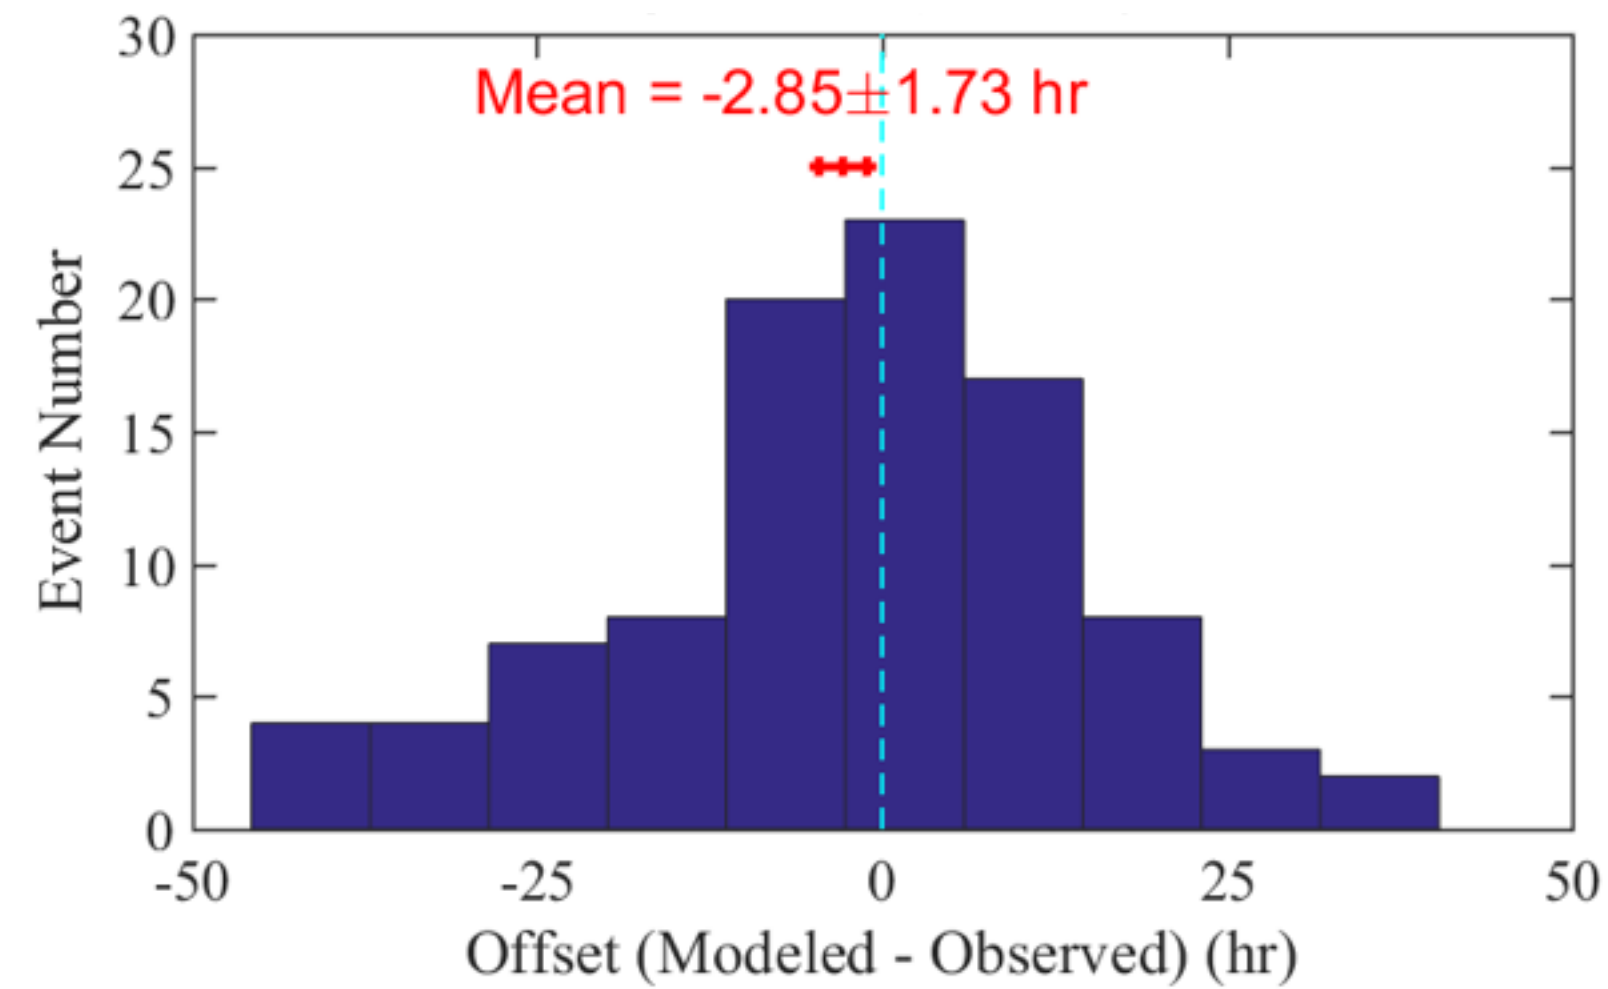

- Solar wind velocity at ecliptic (color scaled) together with IMF lines, heliospheric current sheet, IMF polarity, and CME outlines

# Validation Study — ICME Arrival Time in 2010-2016

|                 | Observed | Captured | Rate of Hits (%) | Rate of Misses (%) | Simulated | Rate of Correct Alarms (%) | Rate of False Alarms (%) | Absoulte Offset of Arrival Time (hr) |
|-----------------|----------|----------|------------------|--------------------|-----------|----------------------------|--------------------------|--------------------------------------|
| ICME            | 170      | 60       | 35.3             | 64.7               | 114       | 52.6                       | 47.4                     | 11.5±1.4                             |
| MC              | 105      | 47       | 44.8             | 55.2               | N/A       | N/A                        | N/A                      | 13.4±1.8                             |
| ICME with shock | 99       | 46       | 46.5             | 53.5               | N/A       | N/A                        | N/A                      | 9.2±1.2                              |

- All CMEs listed in the DONKI “best fit” catalog in 2010-2016 launched into old “a3b1” (left) and new “a8b1” (right) background
- New background provides slight improvement in the prediction accuracy (*see Lan Jian’s talk for details*)
- NOTE: Operational CME fitting realized by various forecasters with various experience and various tools

# Validation Study — ICME Arrival Time in 2010-2016

- All CMEs listed in the DONKI “best fit” catalog in 2010-2016 launched into old “a3b1” (left) and new “a8b1” (right) background
- New background provides slight improvement in the prediction accuracy (see *Lan Jian’s talk for details*)
- NOTE: Operational CME fitting realized by various forecasters with various experience and various tools

# Launching Hydrodynamic Ejecta — Various Approaches & Tools

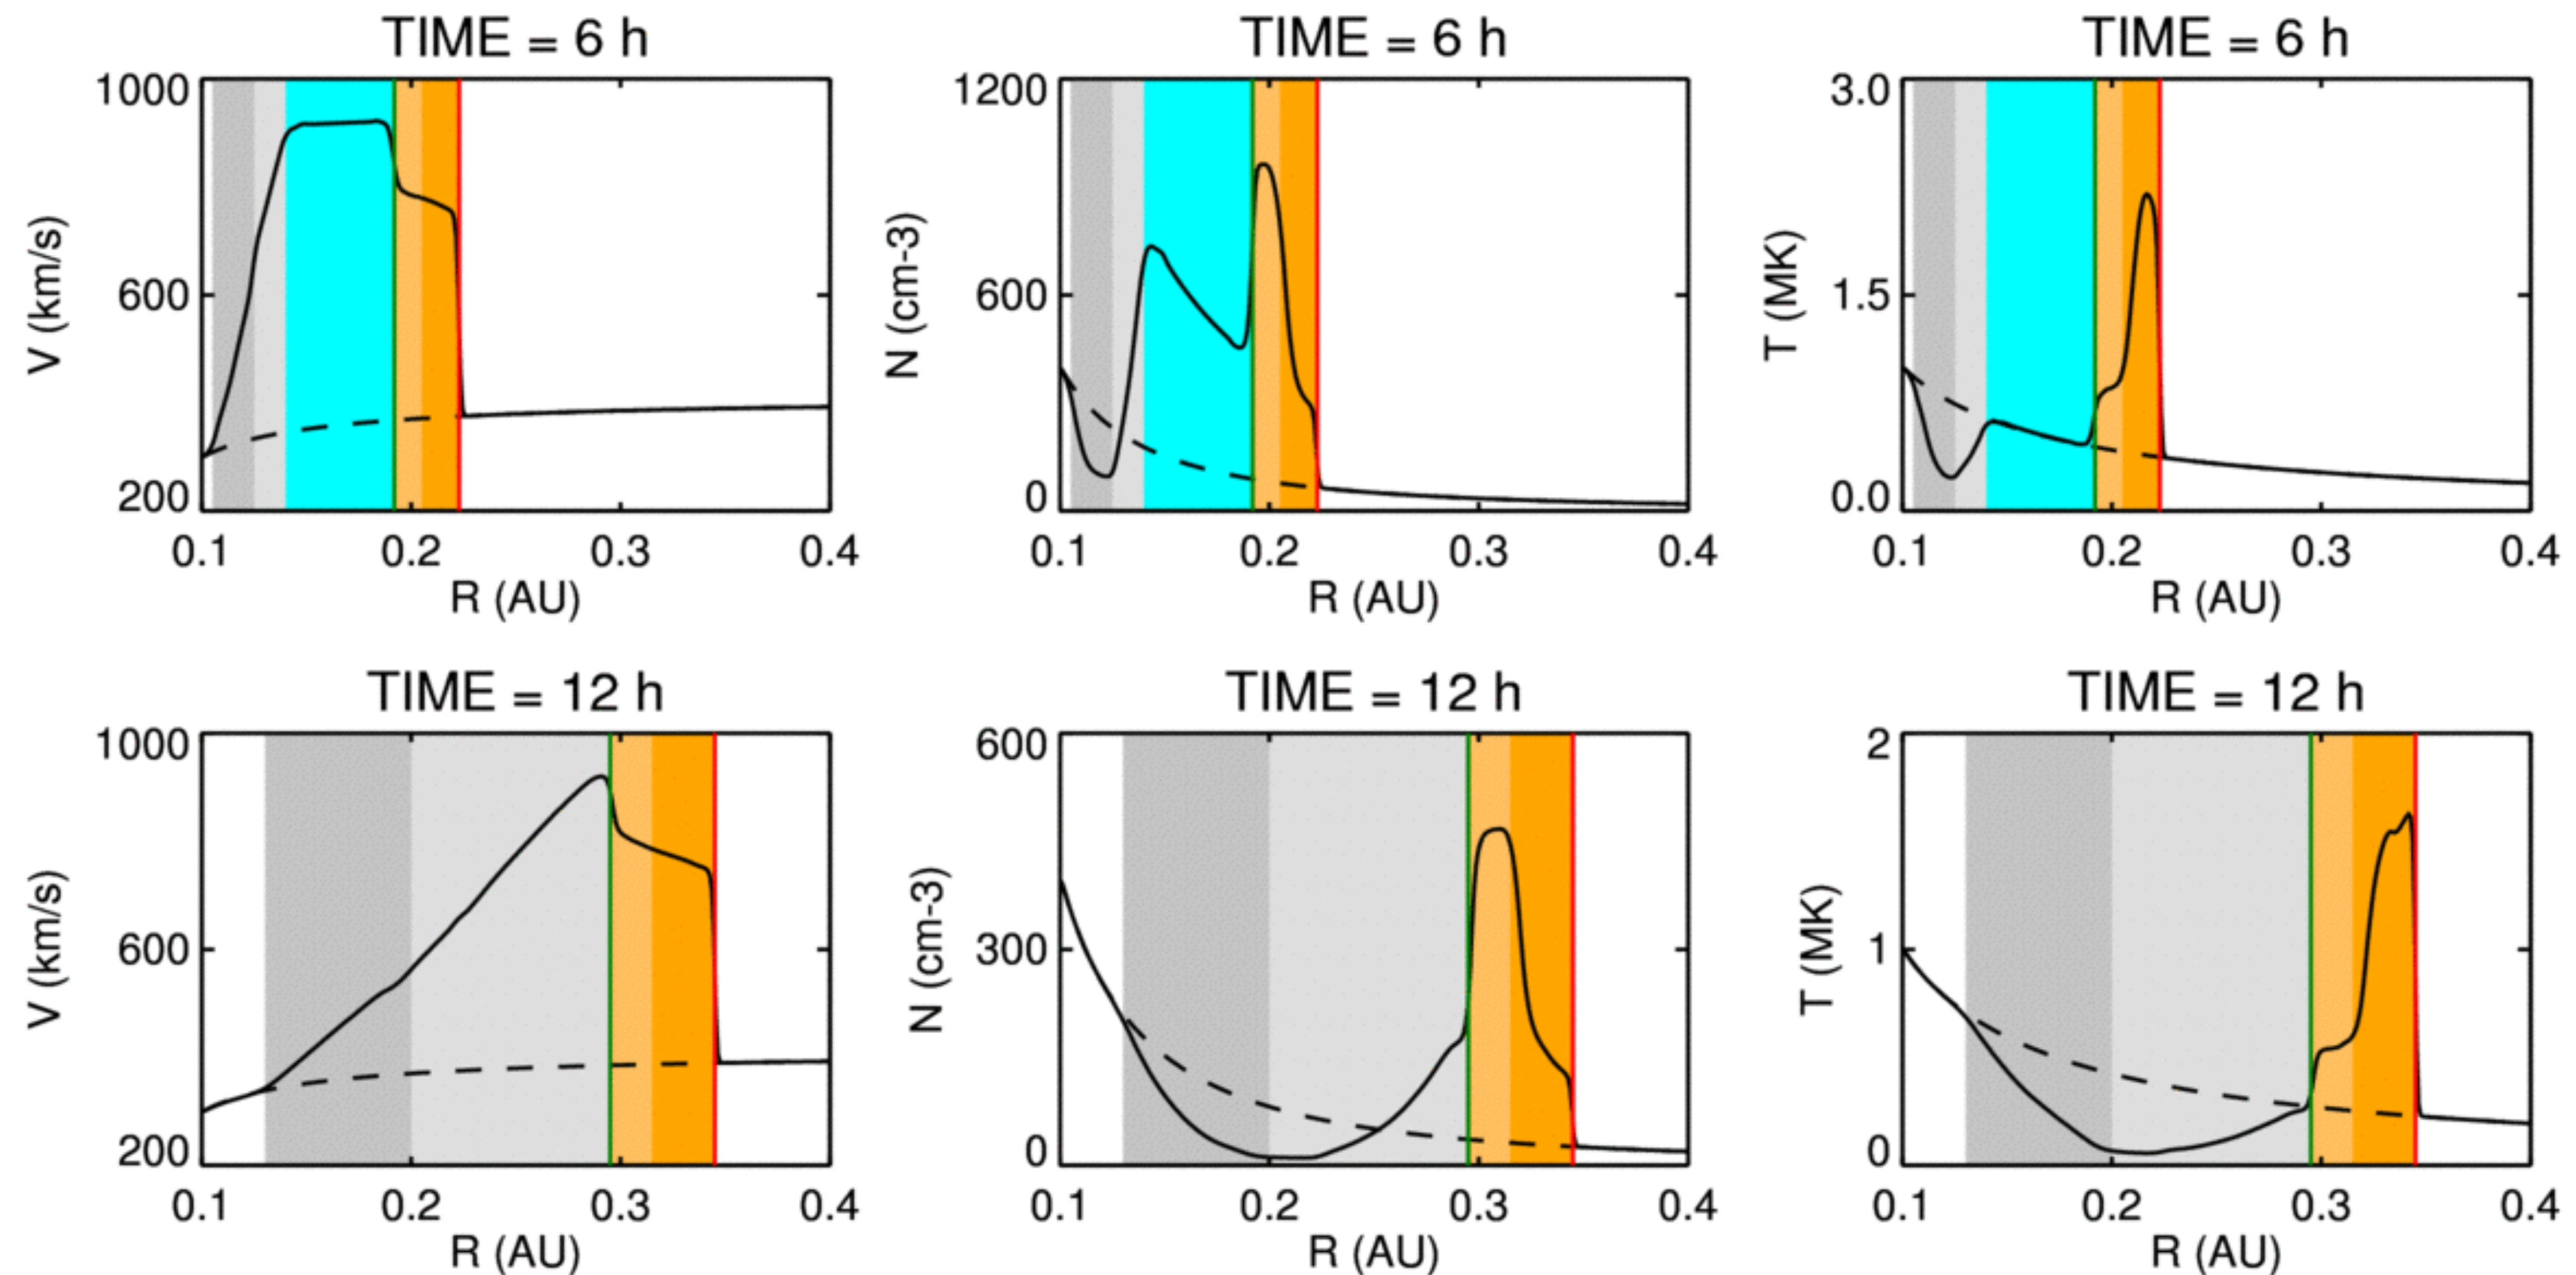

Driver vs compressive waves/shocks  
(e.g., Vourlidas, Zhao, etc.)

Fitting a 3-D structure of the CME (e.g., *Graduated Cylindrical Shell (GCS) model*, Thernissien, 2011)

# Launching Hydrodynamic Ejecta — Generation of Shocks and Rarefactions

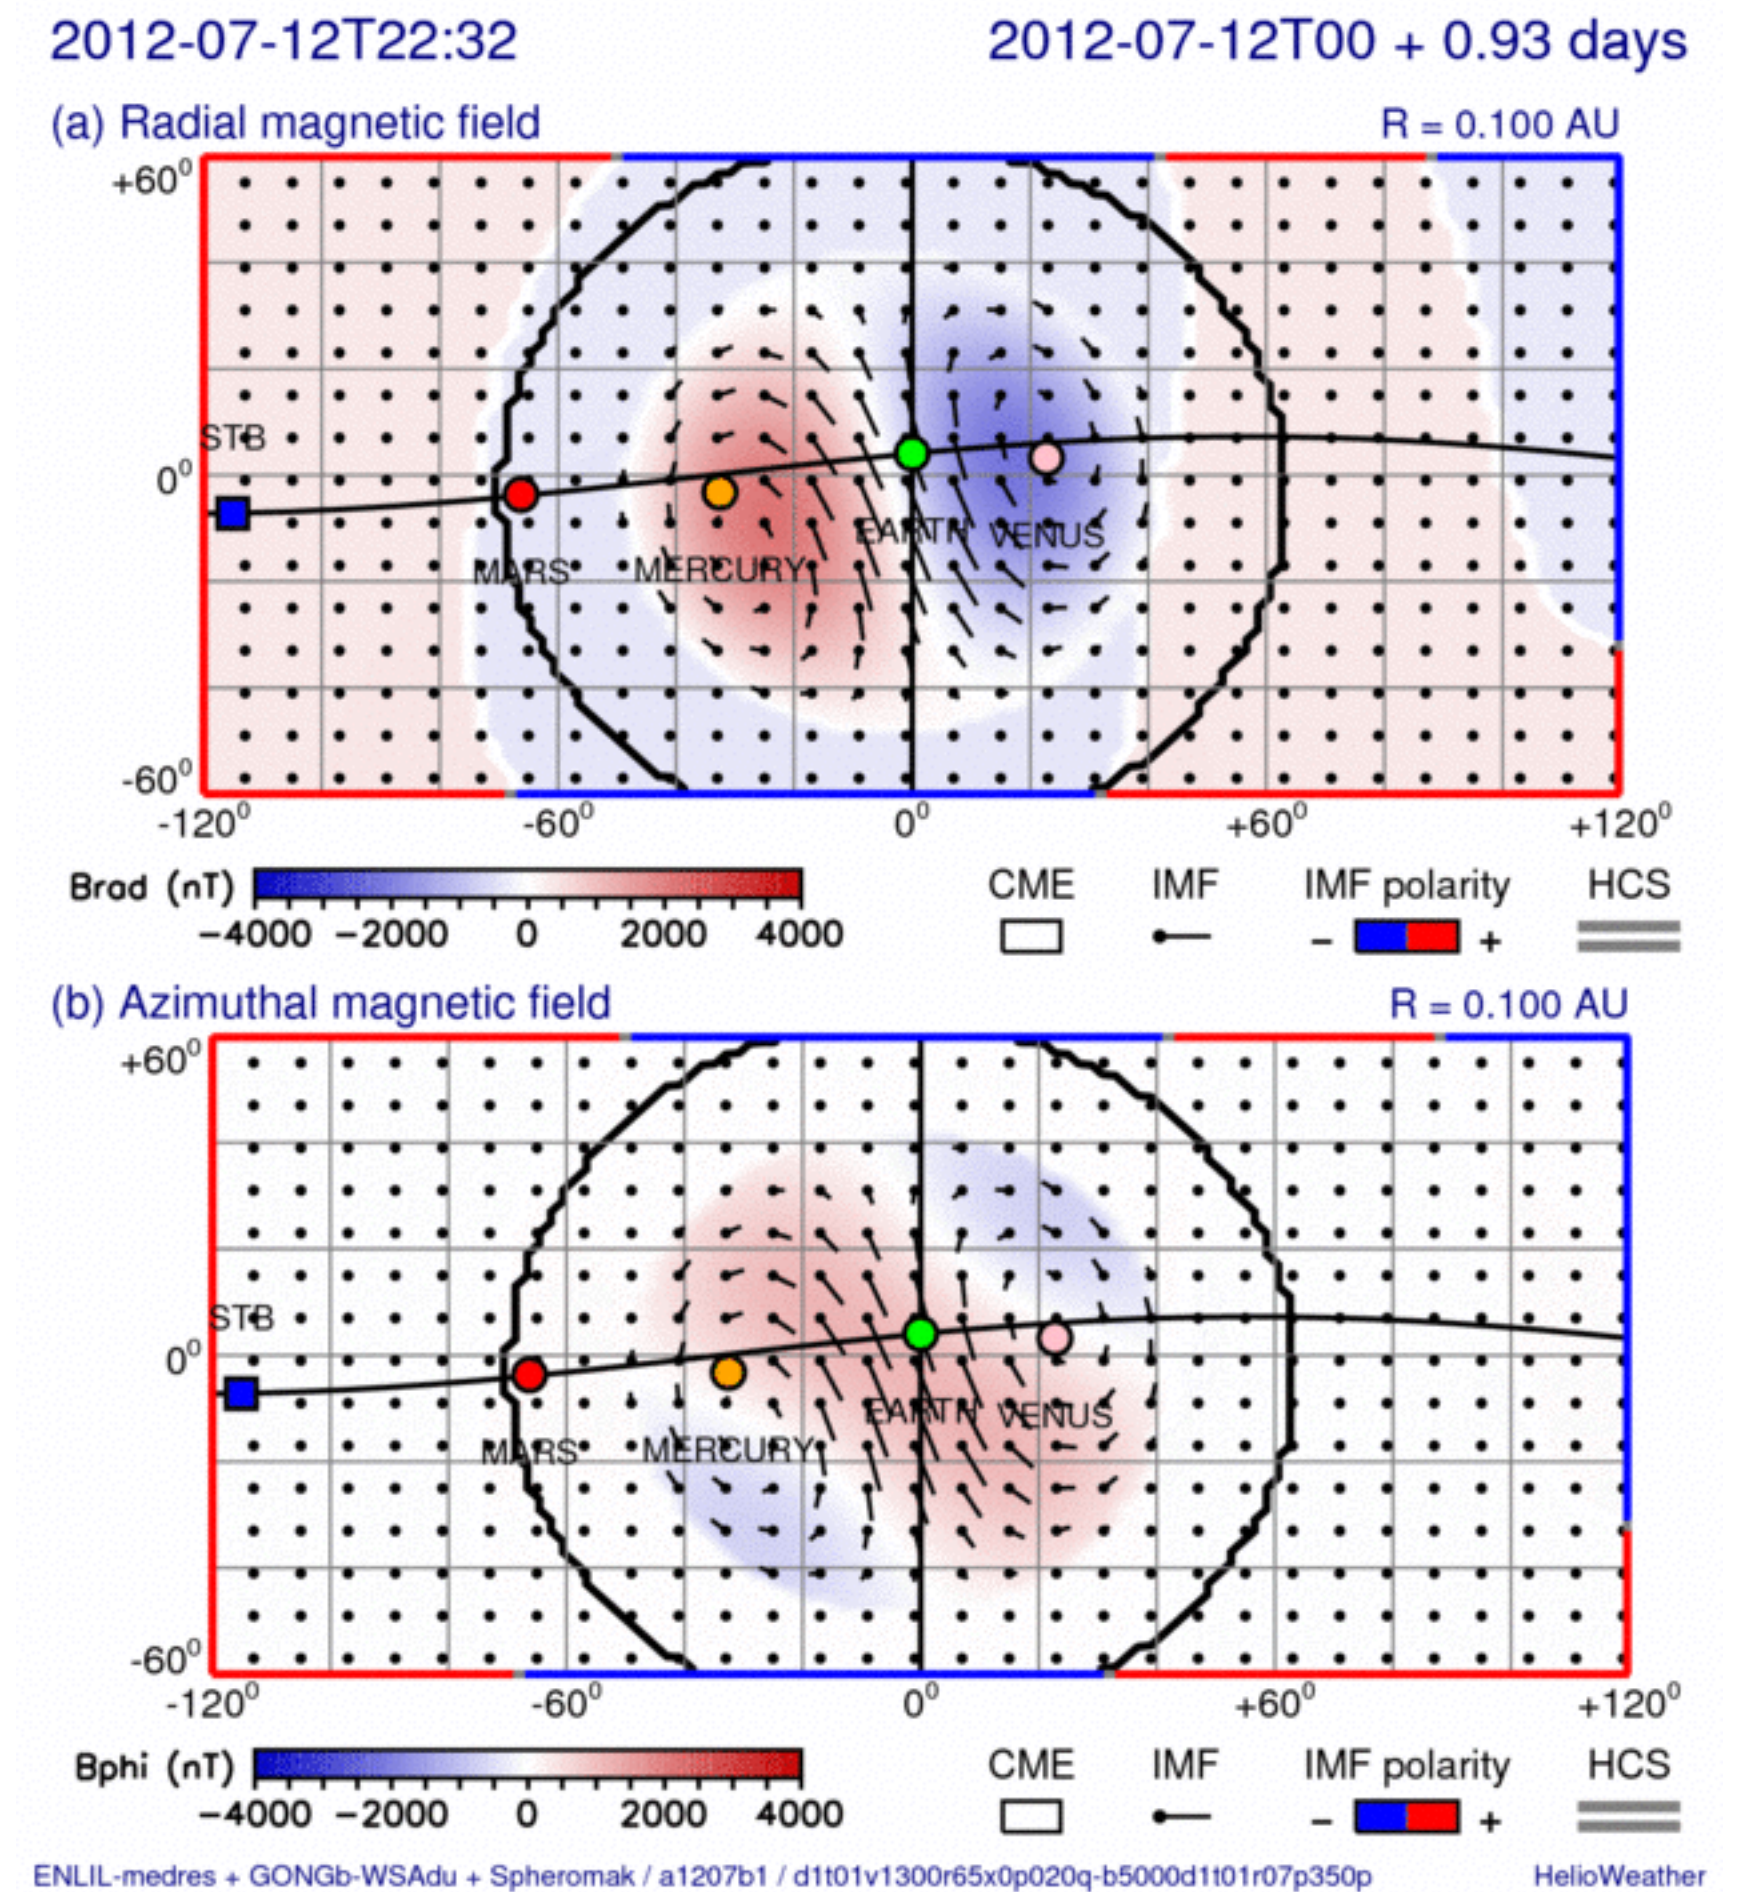

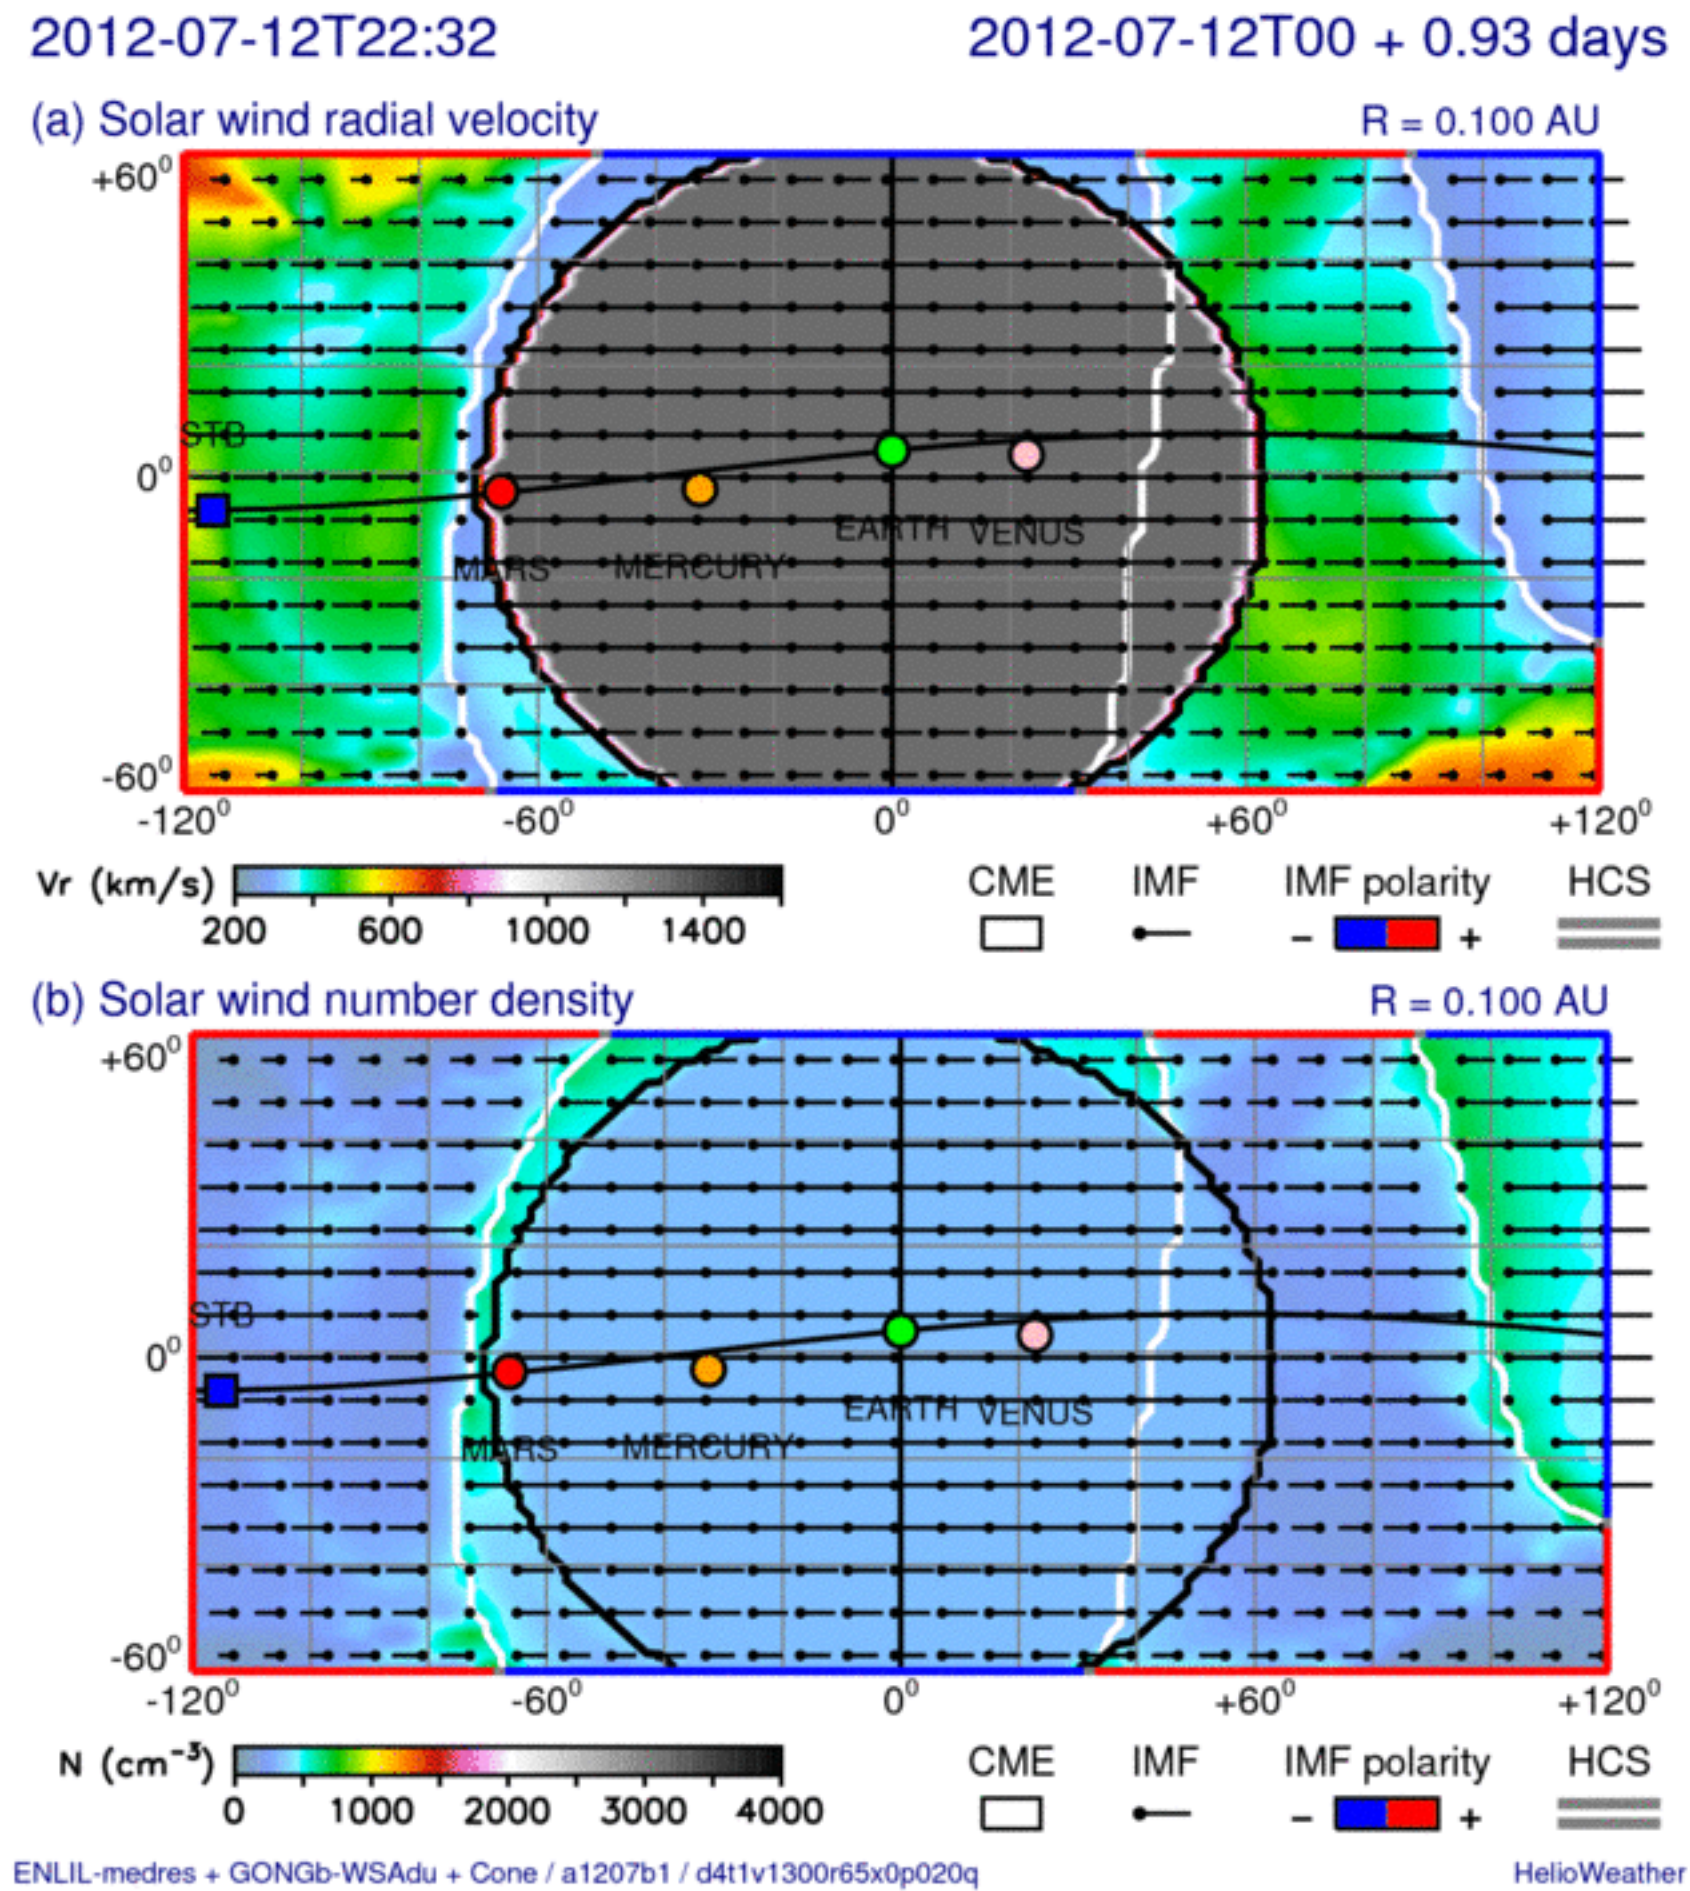

- The structures of the transient disturbance at 6 h (top) and 12 h (bottom) after the launch. The three panels (from left to right) on each row show the radial profiles of velocity, density, and temperature.
- Two shocks (forward and reverse) are generated at the leading edge of the ejecta
- Two rarefactions (forward and reverse) are generated at the trailing edge of the ejecta
- Driving momentum is reduced by a rarefaction that propagates into the ejecta

# Launching Magnetic Structures — Flux-Rope vs Spheromak

# Launching a Spheromak — Boundary Conditions

- All CMEs listed in the DONKI “best fit” catalog in 2010-2016 launched into old “a3b1” (left) and new “a8b1” (right) background
- New background provides slight improvement in the prediction accuracy (see *Lan Jian’s talk for details*)
- Operational CME fitting realized by various persons with various experience and various tools

# 2012-07-12 CME Event — Spheromak Simulation

2012-07-15T00:00

(a) Ecliptic plane

EARTH

(b) Meridional plane

2012-07-12T00 + 3.000 days

(c) Temporal profiles

IBI (nT) 0 5 10 15 20 25 30

IMF CME

IMF polarity - +

HCS

ENLIL-medres + GONGb-WSAdU + Spheromak / a1207b1 / d2105v1000r65x0p020q-b5000d2105r06p350p / g53h10b02 / mcp1um1cd

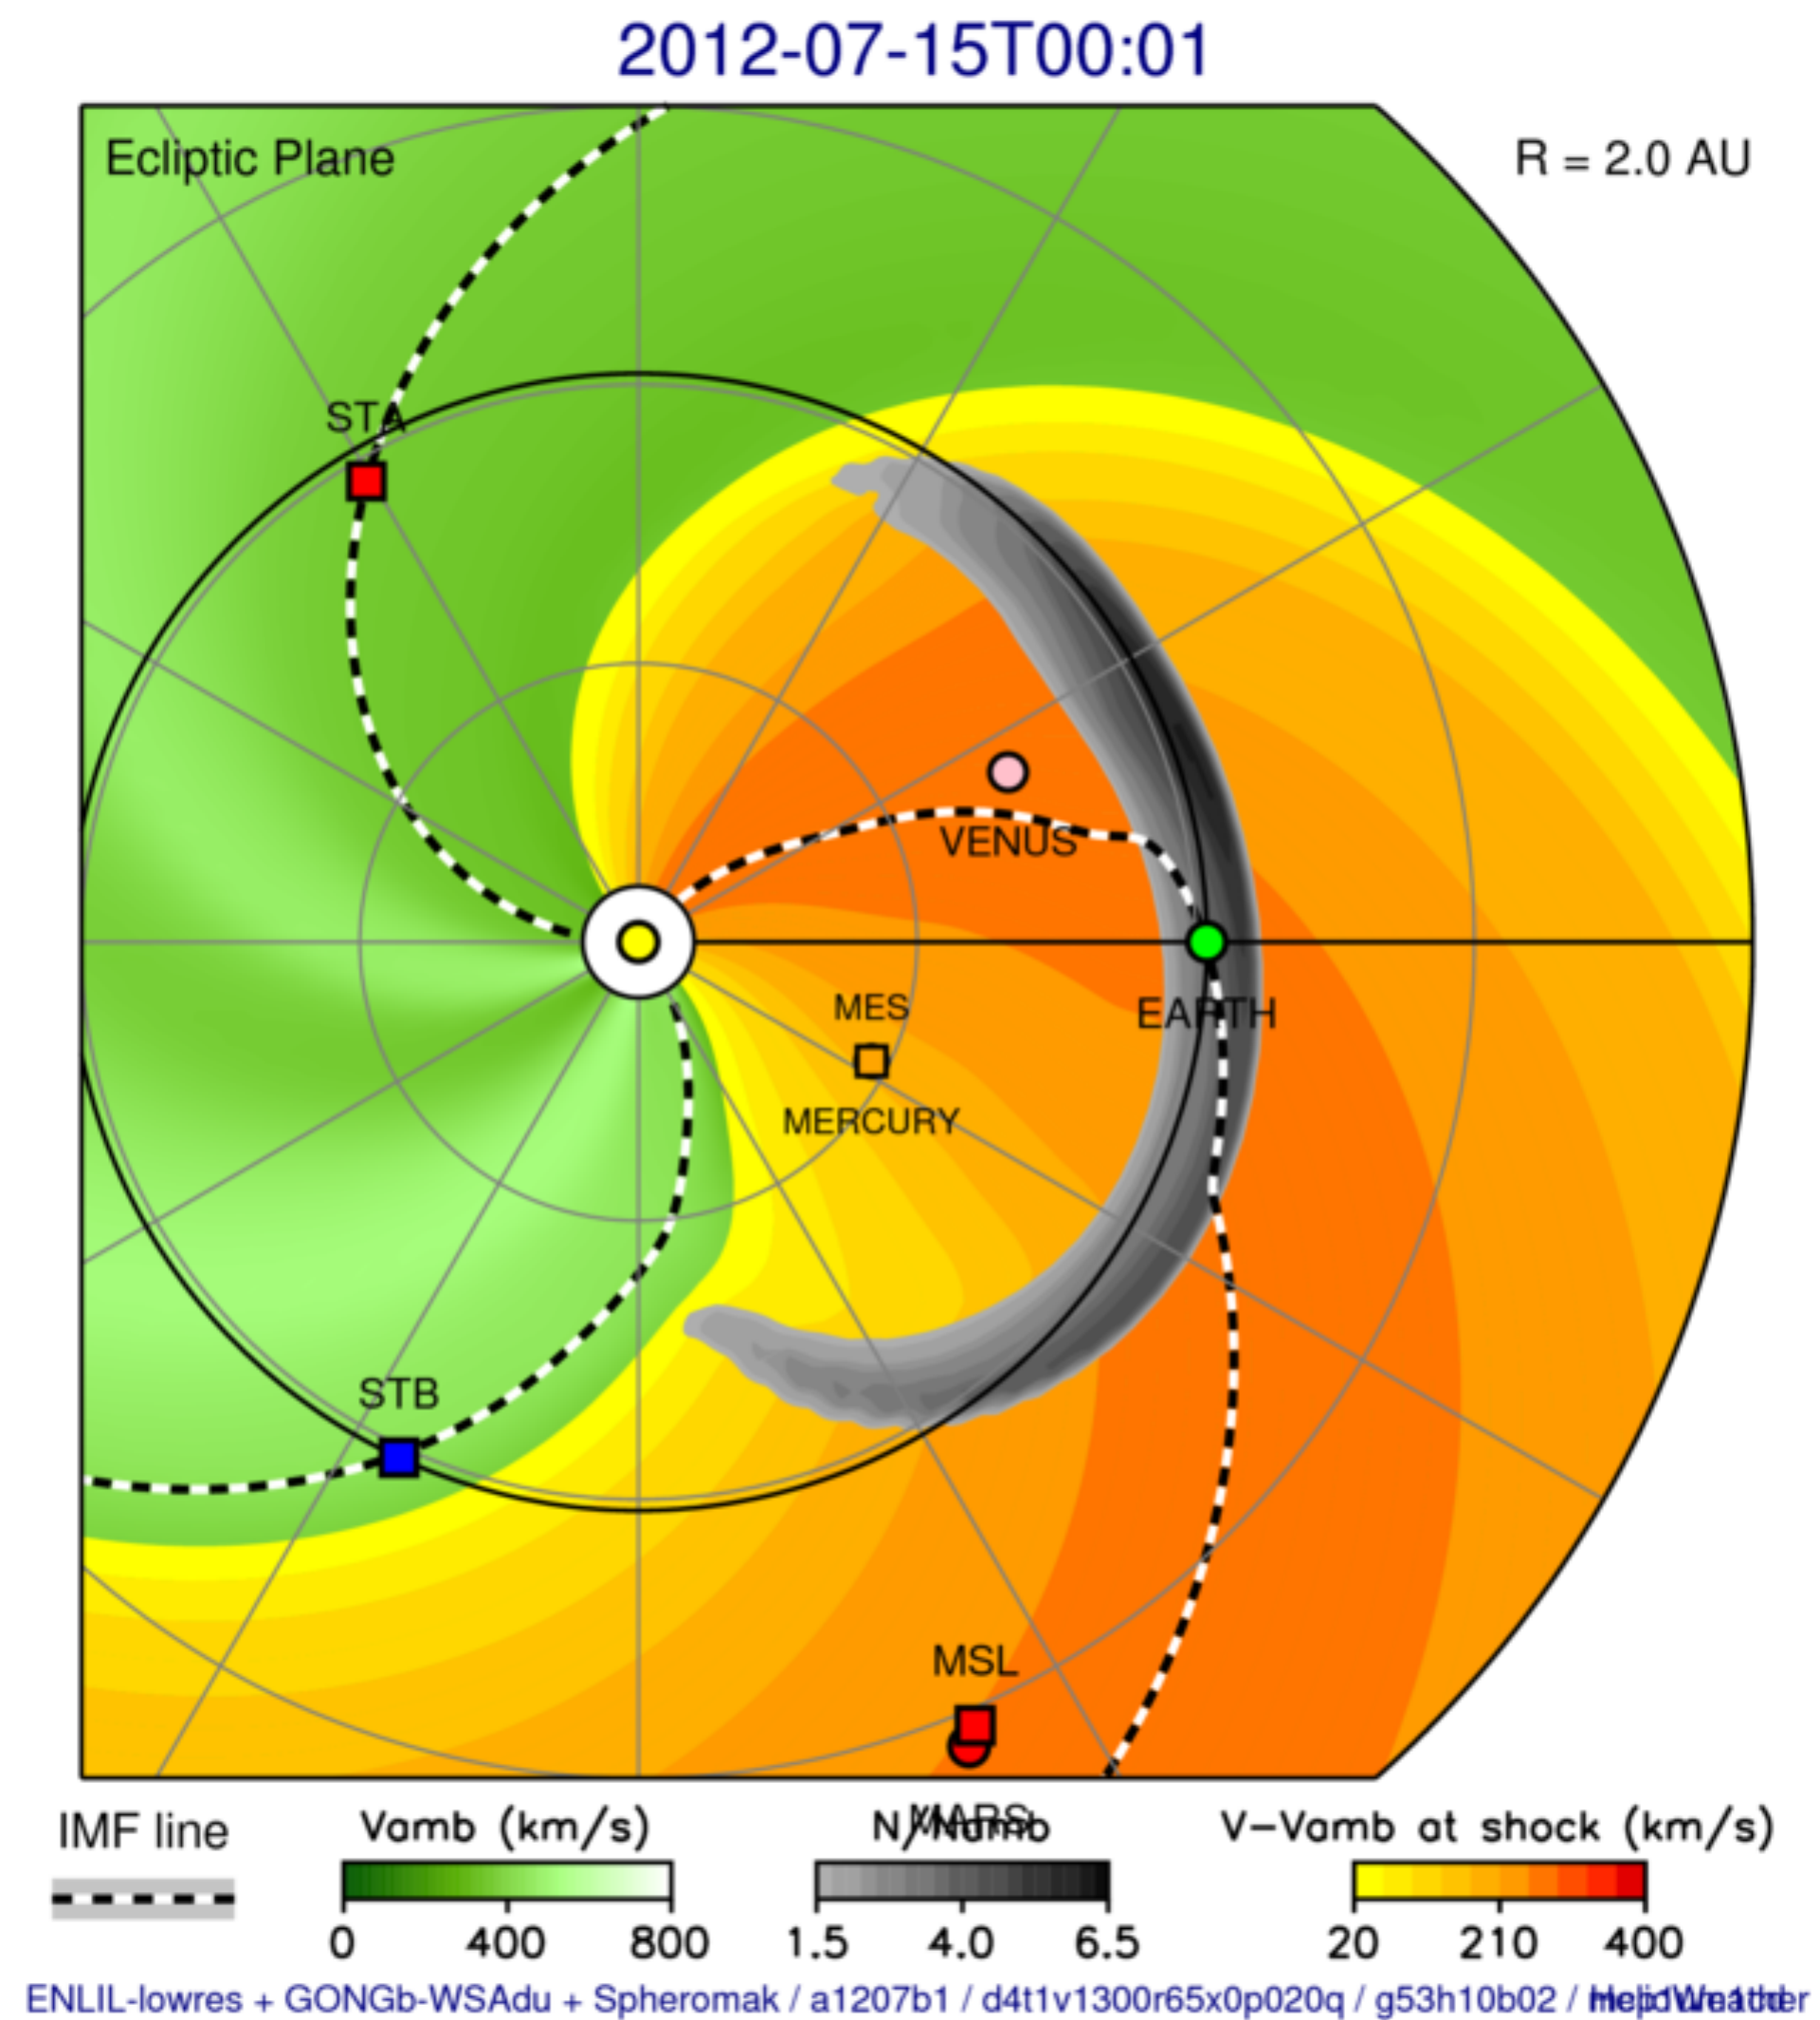

HelioWeather

- Geometric and kinematic parameters (direction, width, and speed) from CME fitting (DONKI)
- Model-free parameters (density, temperature, magnetic field) adjusted to achieved similar arrival time at Earth as predicted by cone simulation.
- This is challenging and revision of the CME fitting & model initialization is needed

# IMF Connectivity — Cone (left) vs Spheromak (right)

# Shock Alert Prediction — Cone (left) vs Spheromak (right)

Shock-alert plot for the cone (left) and spheromak(right) simulations shows the solar wind velocity (green scale), density compression of the transient leading edge (dark-grey scale), and alert sectors colored by the shock strength (yellow-to-red), and the IMF lines passing through Earth and STEREO (dashed black lines).

# SEPMOD Predictions — Cone (left) vs Spheromak (right)

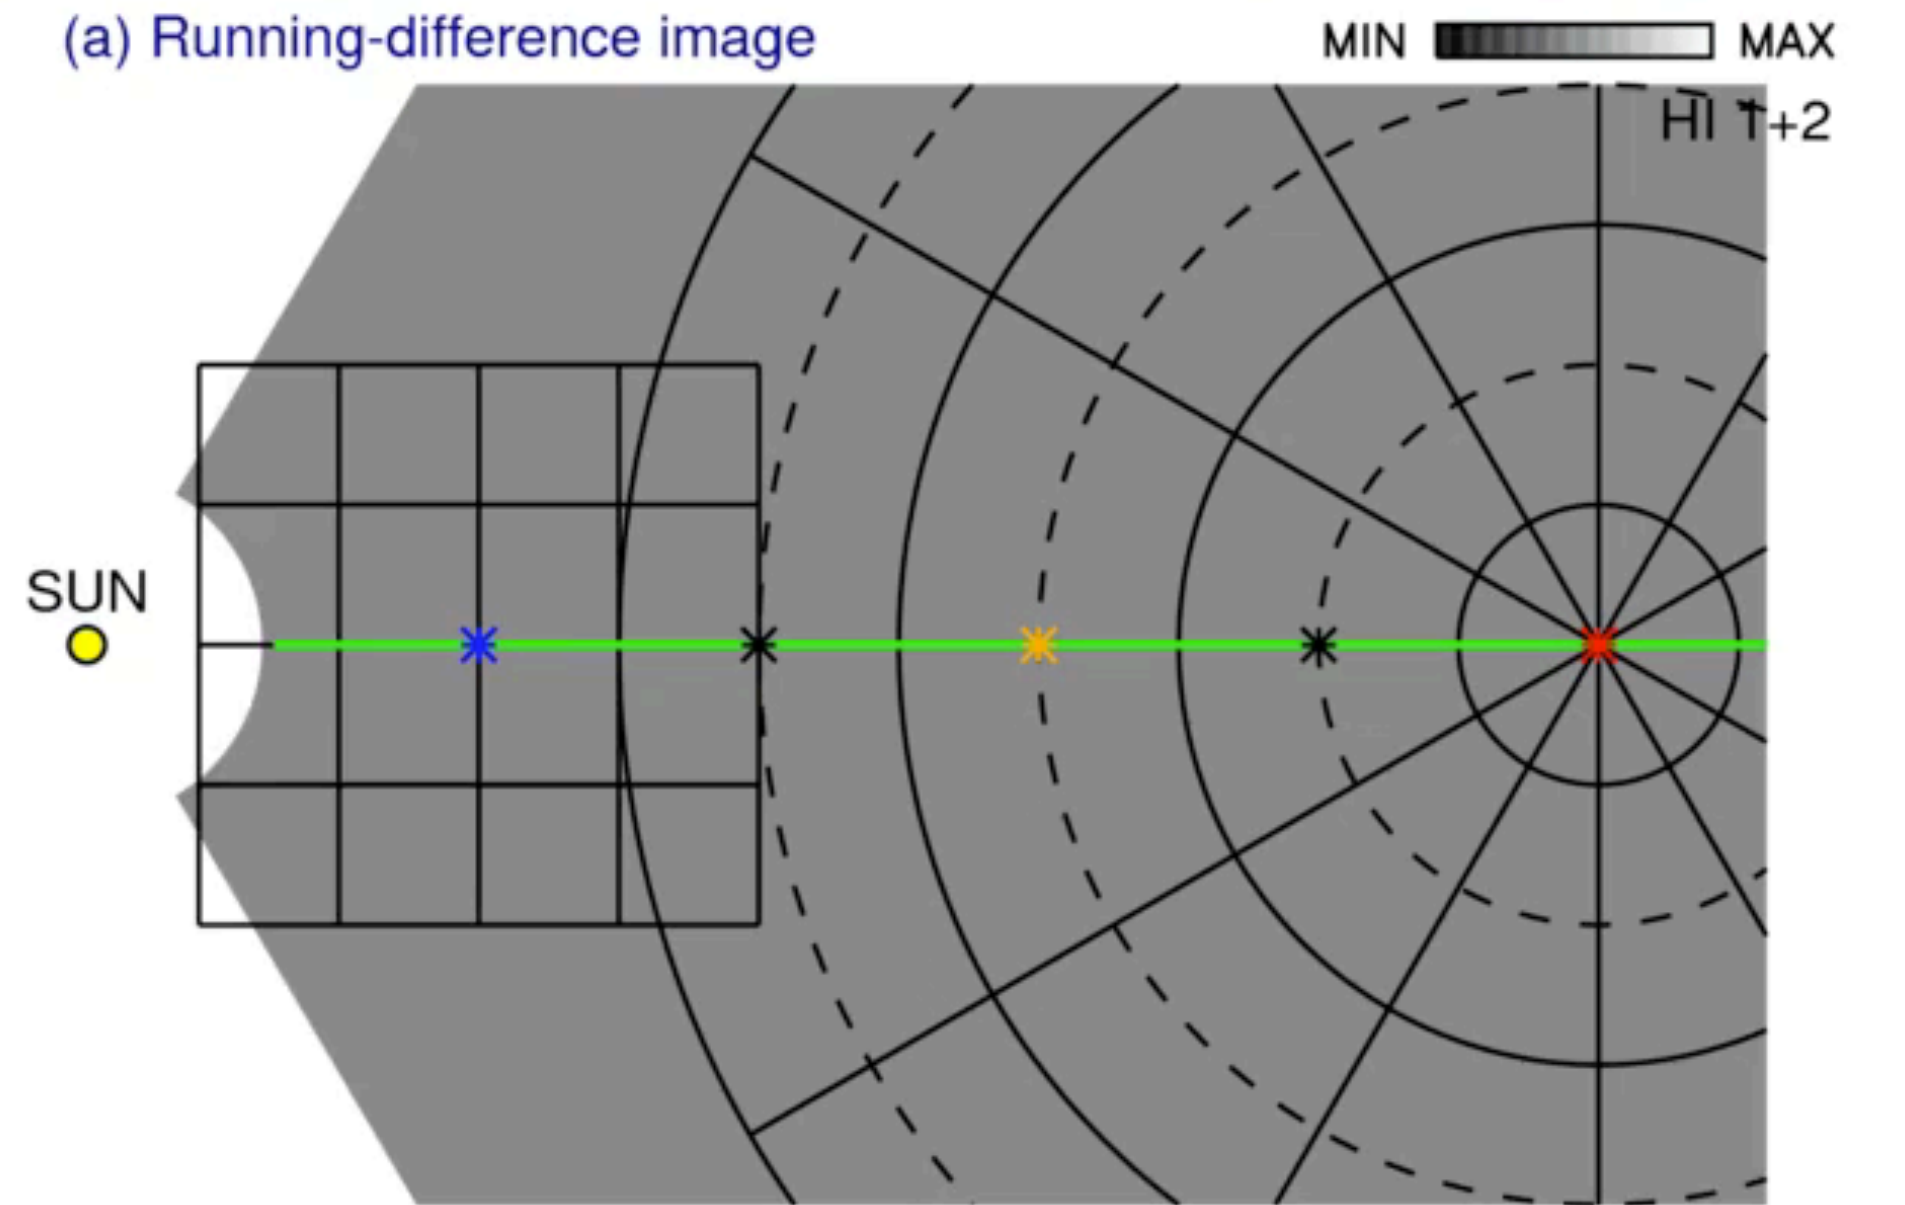

Earth-observer results of running SEPMOD on the test case of the ENLIL results with the cone (left) and without spheromak (right) launched into the heliospheric computational domain. The parameters of the spheromak were adjusted to make the shock arrival time similar, as seen in the second panels. SEP observations are shown in the top panels. Differences in the calculated SEP profiles (bottom panels) for the two ENLIL cases are subtle but significant.

# Application of Synthetic White-Light Imaging

STEREO-B 2012-07-12T00:02

(a) Running-difference image

(b) J-map at Ecliptic

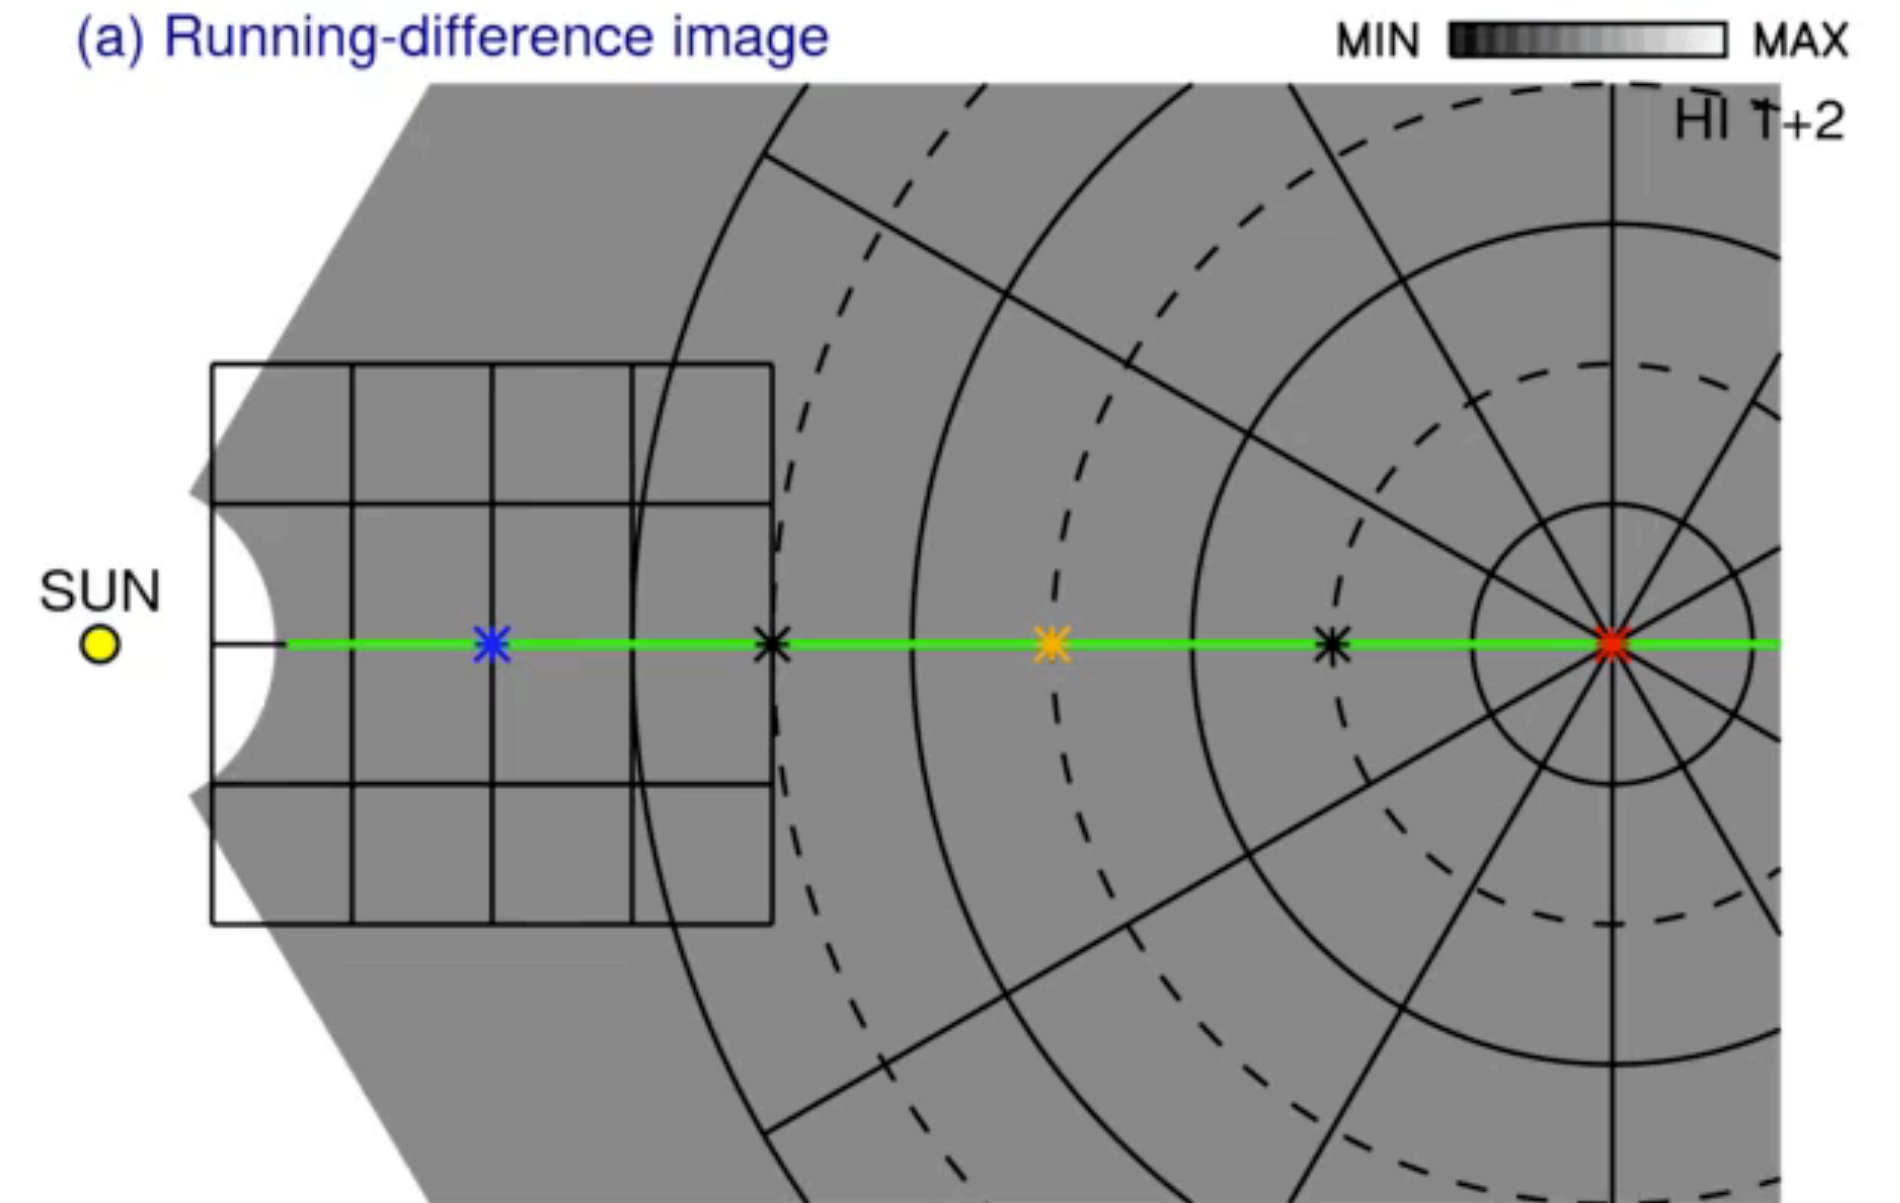

ENLIL-medres + GONGb-WSAdu + Cone / a1207b1 / d4t1v1300r65x0p020q / g53h10b02 / mcp1

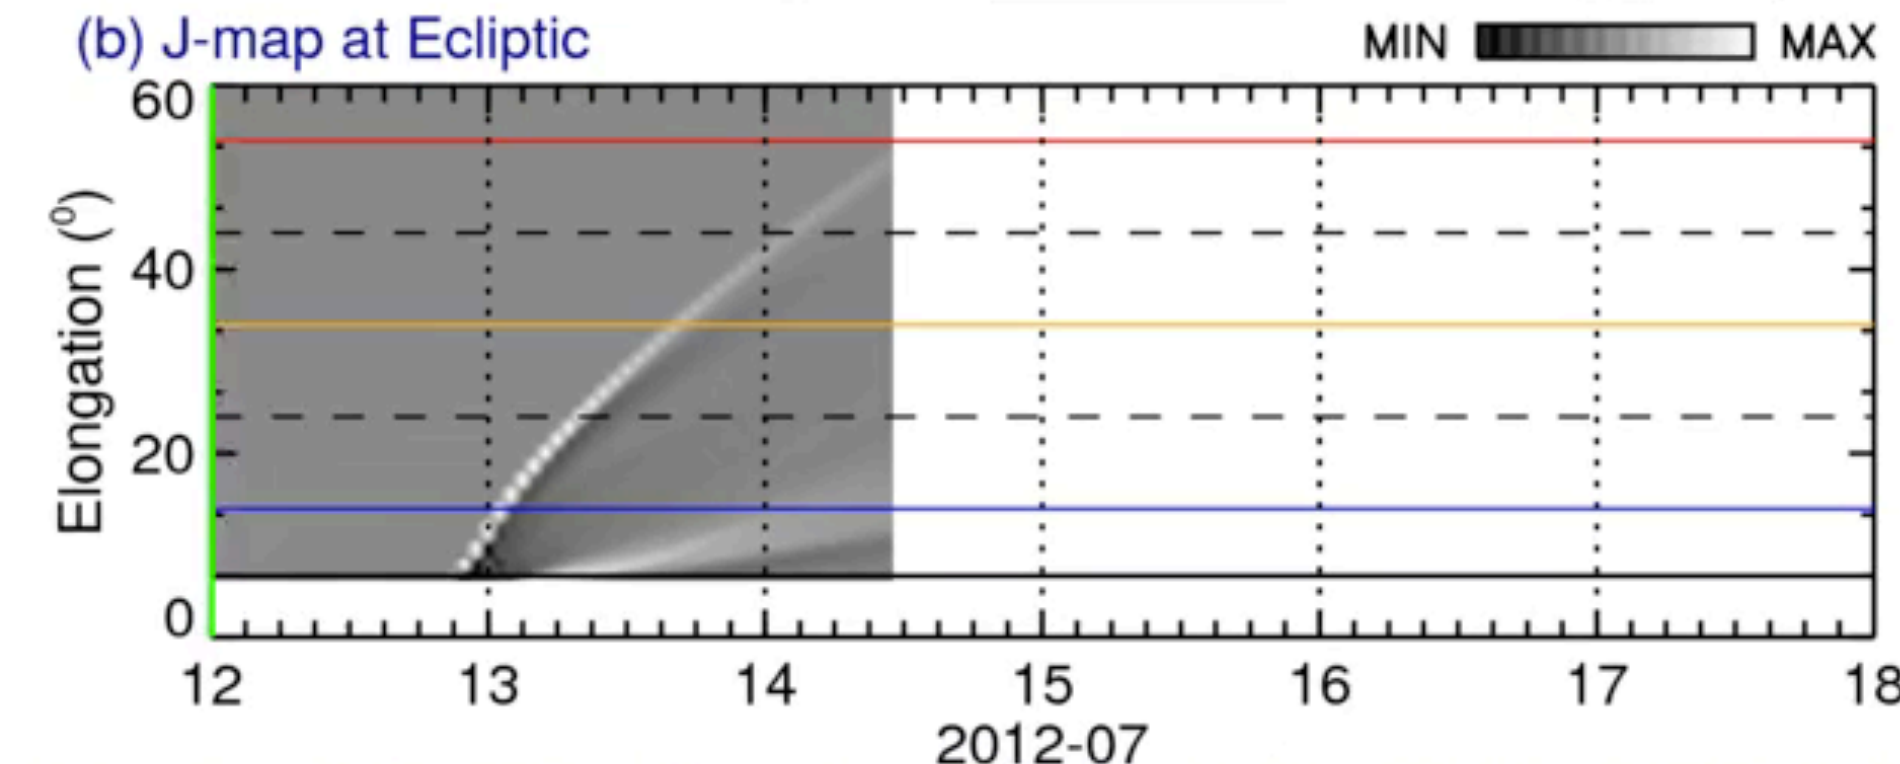

STEREO-B

2012-07-12T00:02

(a) Running-difference image

(b) J-map at Ecliptic

ENLIL-medres + GONGb-WSAdu + Spheromak / a1207b1 / d1t01v1300r65x0p020q-b5000d1t01

- Remote observations by heliospheric imagers (STA & L4) can provide evaluation of various numerical predictions well before corotating and/or transient disturbances arrive at Earth
- Streams visibility can be enhanced by launching small-scale plasma “blobs”

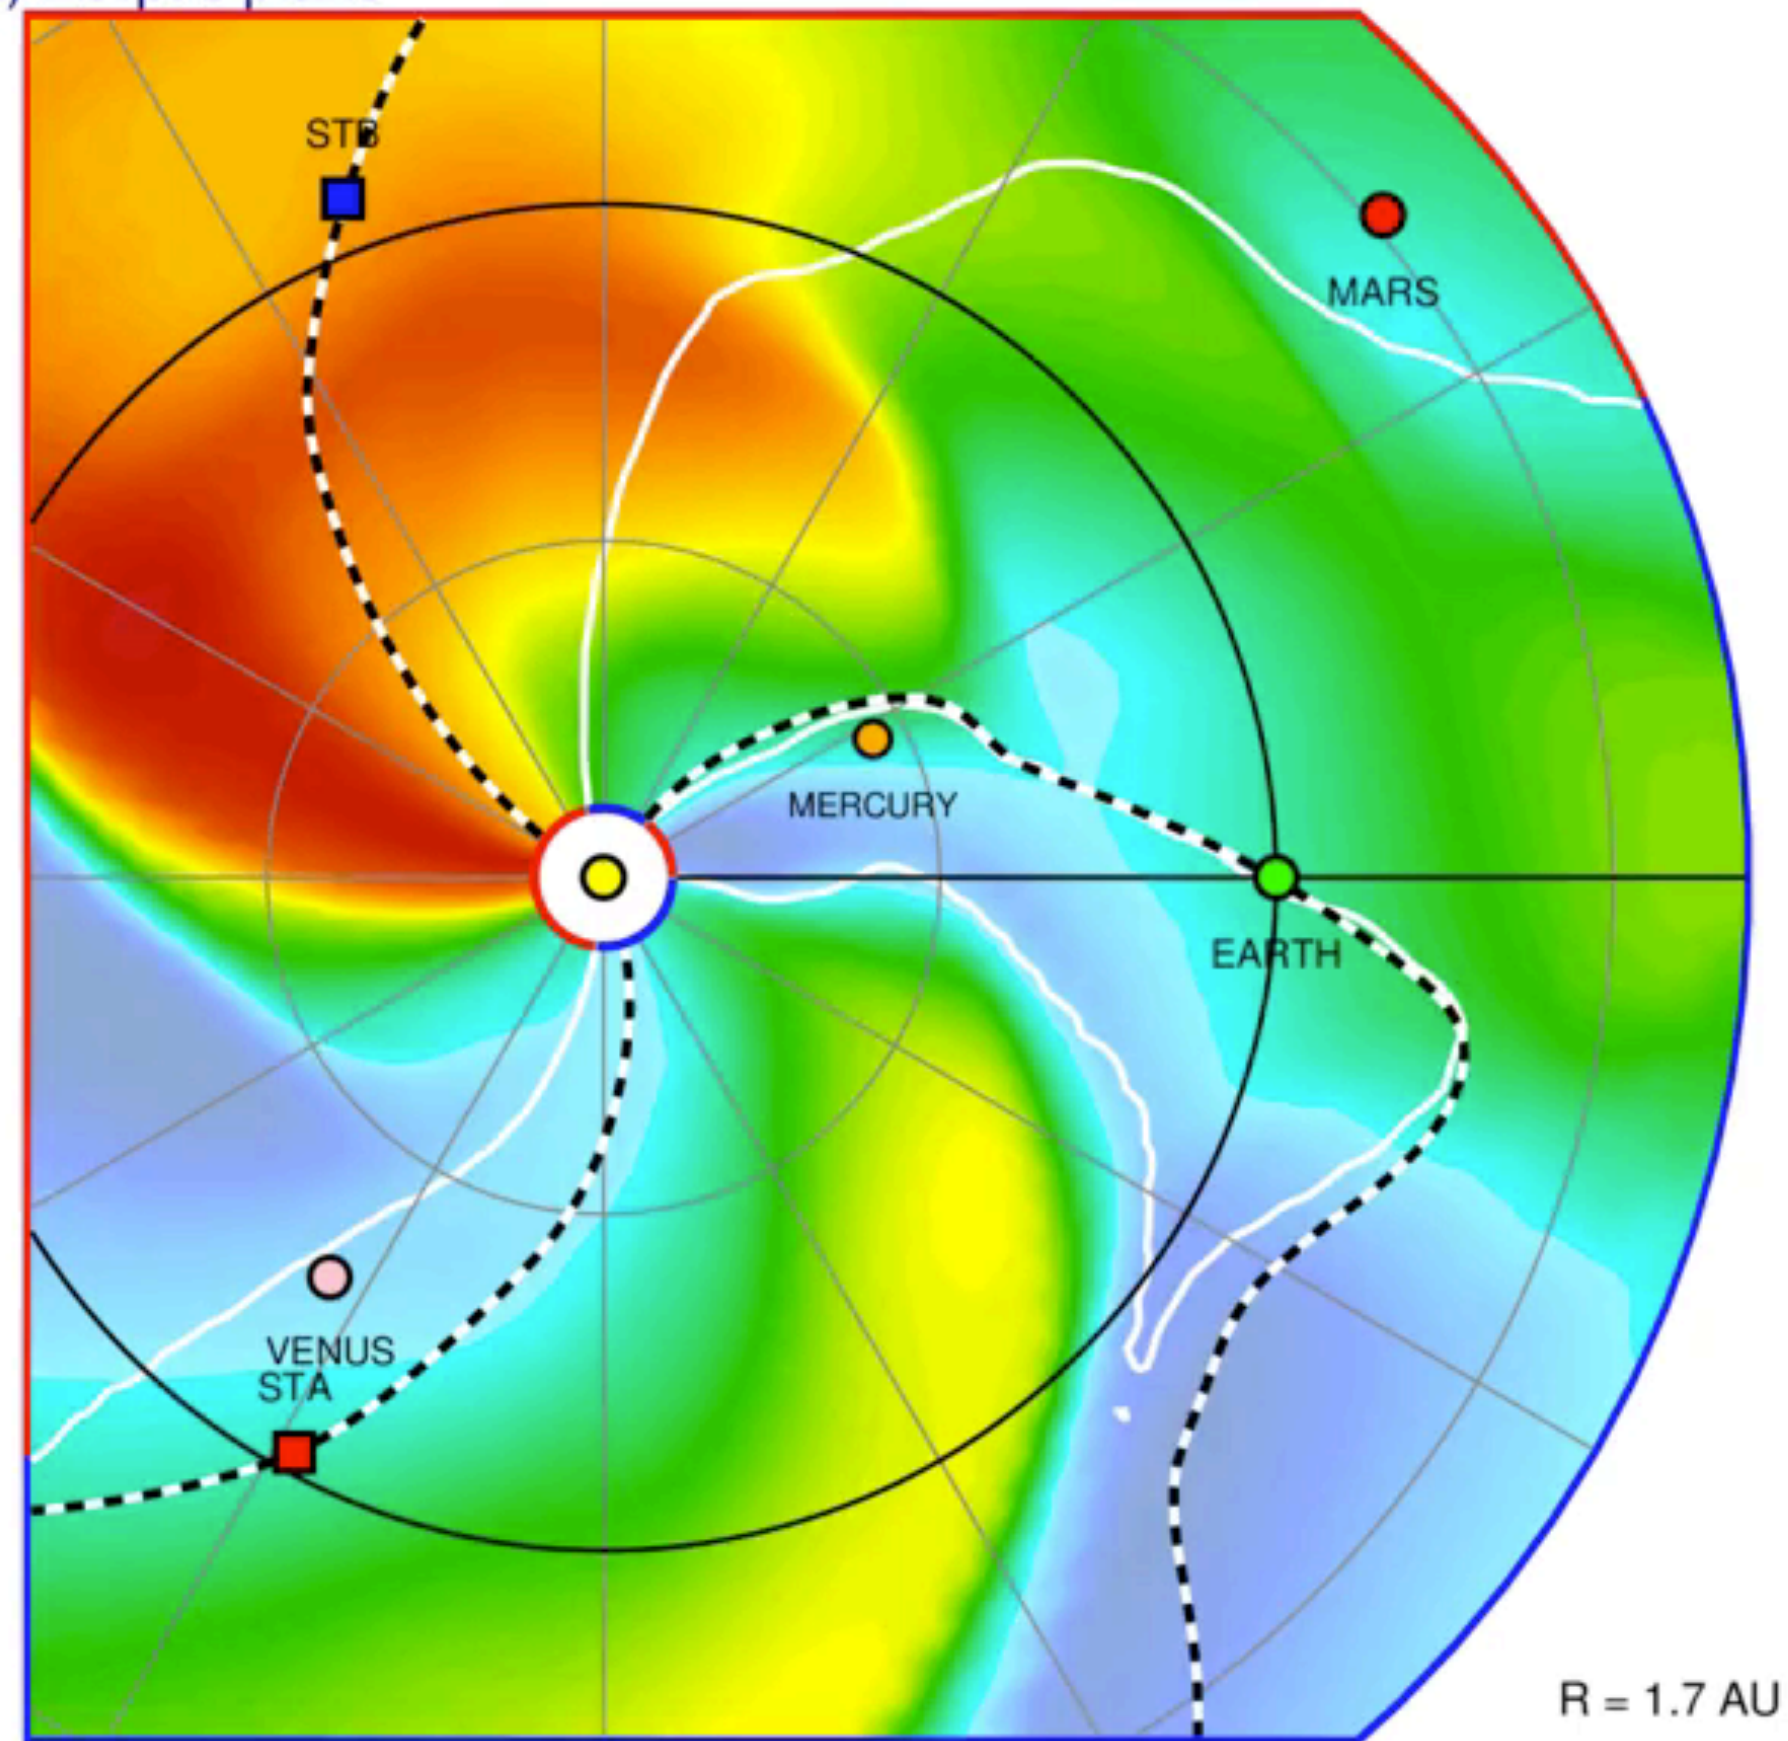

# Using IPS Data to Drive Heliospheric Predictions

2018-04-14T00:02

EARTH

2018-04-24T00 - 10.000 days

(a) Ecliptic plane

ENLIL-lowres + ISEE-UCSD

(b) Temporal profiles

- IPS observations from STELab + UCSD tomographic reconstruction — values at 0.1 AU
- Time-dependent boundary values drive ENLIL heliospheric computations
- Fully automatized alternative (backup) to coronagraph fitting — will improve with more radio arrays

# Summary

- Updated WSA-ENLIL-Cone modeling system can now routinely predict:
  - ICME arrival times (ejecta and/or shock) in mid-heliosphere
  - ensemble modeling
  - evolving background solar wind
  - IMF topology and shock parameters for SEP models & alert plots
  - synthetic white-light images (for “mid-course” correction)
  - use UCSD-IPS data for alternative “backup” predictions
- We realized large-scale calibration & validation studies to evaluate new features, compare with previous versions, and with other models implemented at CCMC
- Updated WSA-ENLILCone modeling system facilitates:
  - direct comparison with remote and in-situ observations at planets and spacecraft
  - high-quality images and animations red for presentations/publications
  - scripting system to support research and prediction activities
  - supports heliospheric predictions & mission planning relevant to NASA missions
- We very appreciate collaboration with the CCMC staff that helped us to compensate the budget reduction, provided modeling support and feedback, and enhanced research and prediction applications
