

Metrics for Global Time-Dependent Observational Data: TEC Example

Barbara Emery (HAO/NCAR)

Larisa Goncharenko and Anthea Coster
(madrigal MIT)

conveners

Example: foF2 in models, 11 Sep 2005

IRI

DfoF2 (MHz) 18:00 UT 11.09.2005

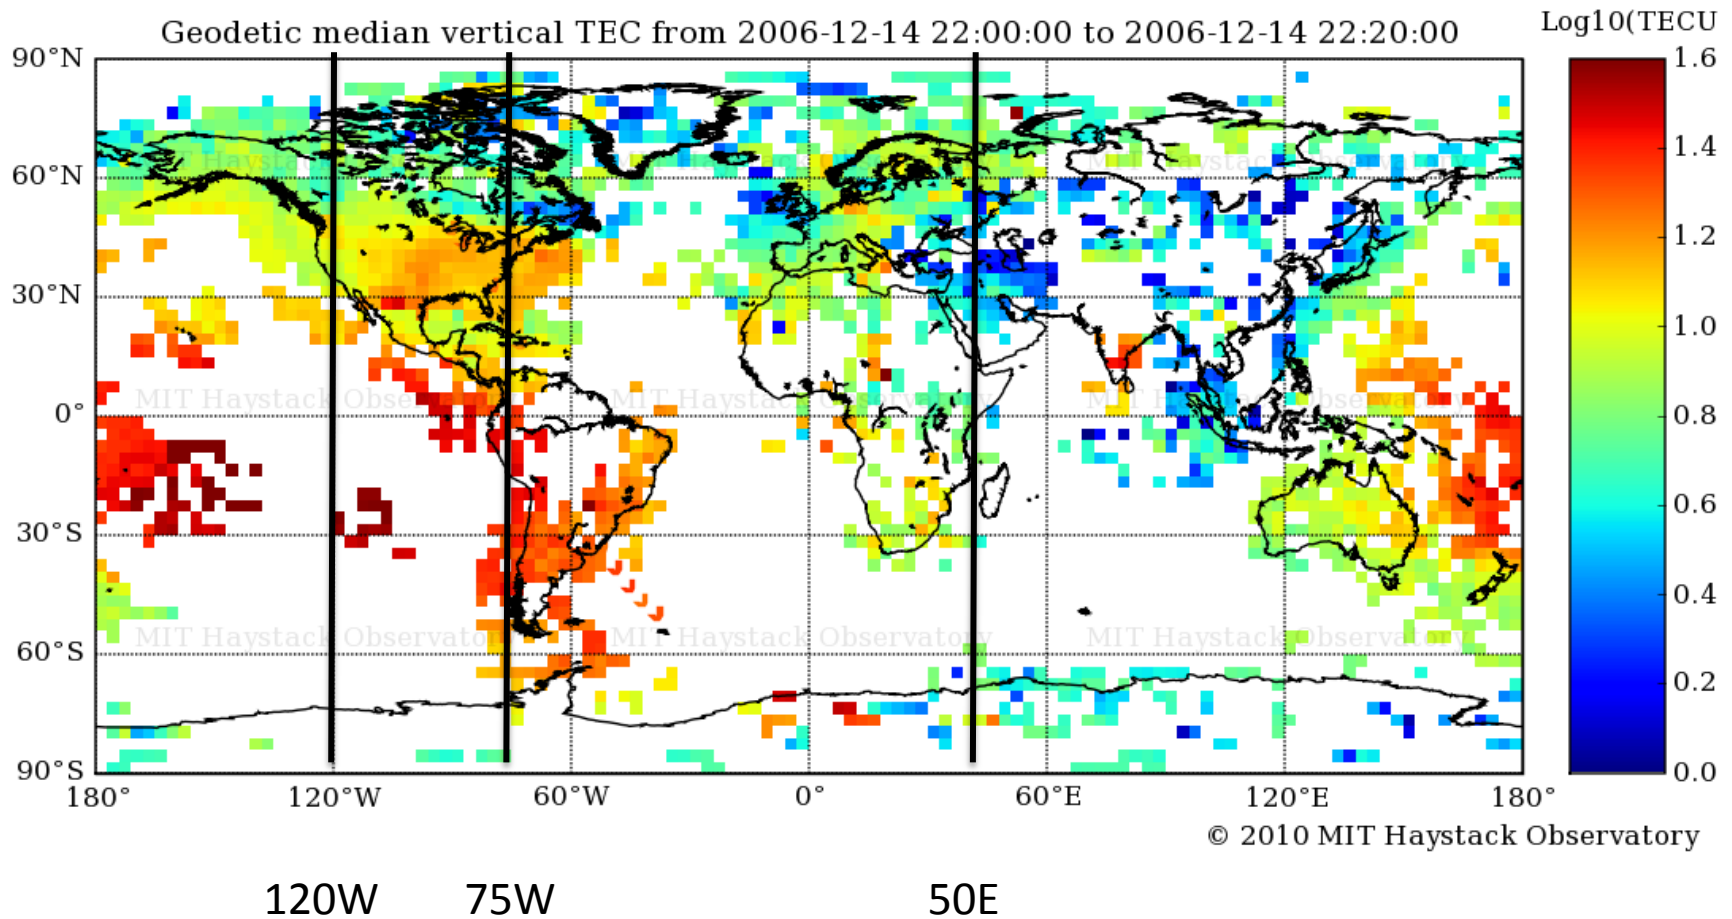

- IRI:
 - narrow area of positive storm effect
- GCM TIP:
 - wider area of positive storm effect
 - complex structures in longitude
- ISR radars:
 - Much stronger positive storm effect

GCM TIP

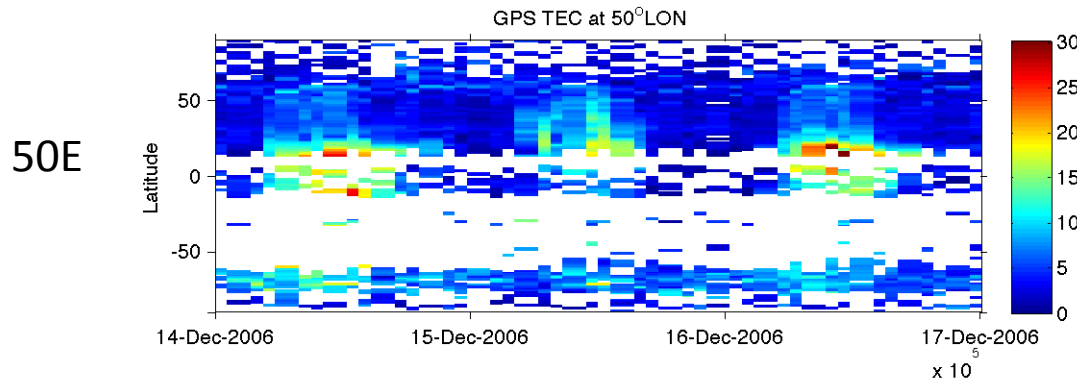

DfoF2 (MHz) 18:00 UT 11.09.2005

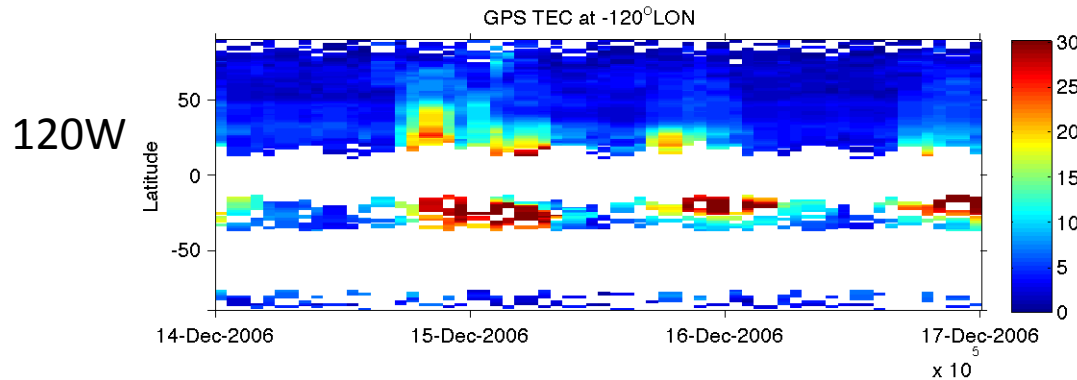

Example: GPS TEC on Dec 14, 2006, 22UT

Example: GPS TEC on Dec 14-16, 2006

- TEC data at three longitudes
- 1-hour bins
- 3 deg in lat

Making Global Data “Manageable”

- TEC ground stations: ~300 in 2000, ~2000 in 2008, every 5 min
 - Add TOPEX, JASON and COSMIC for ocean and land coverage (sparse)
- Choose ~5 longitude slices: 5 deg in glon, 5 deg in glat, every 20 min
 - max 36 lat bins (probably ~15) * 5 slices = ~75 “stations”

FUTURE

- **Fall AGU TEC posters** (**Please contact leaders to join in!**)
 - Ja Soon Shim et al.: Dec 2006 event
 - Emery/Goncharenko/Coster/Scherliess/Shim/etc et al. climatology during IPY solar minimum (Mar07-Mar08) from GPS (ground and satellite)
 - Delete storm days and consequent positive and negative storm effects
 - ~2month averages, ~15 deg glon, ~5 deg glat, each 1h UT

CEDAR Workshop 2012 Events and Climatology Challenge for TEC
